Preface	ix
Chapter 1. Introduction to Aerial Robotics	1
1.1. Aerial robotics	1
1.1.1. The rise of UAVs in the civil sector	2
1.1.2. Mini-UAV designs	4
1.2. The Paparazzi project	5
1.3. Measurement techniques	8
1.3.1. Proprioceptive sensors	10
1.3.1.1. Gyroscopes	10
1.3.1.2. Accelerometers	12
1.3.2. Exteroceptive sensors	15
1.3.2.1. Satellite positioning systems	15
1.3.2.2. Barometric altimeters	16
1.3.2.3. Magnetometers	17
1.3.2.4. Cameras and telemeters	18
1.3.3. Inertial systems	19
1.4. Motivation	20
Chapter 2. The State of the Art	23
2.1. Basic concepts	23
2.2. Literature review	31
2.2.1. Important milestones	31
2.2.2. Historical overview	33
2.3. Optimal filtering with linear system models	39

2.3.1. Linear Kalman filtering algorithm	39
2.3.2. Extension to nonlinear models	42
2.4. Approximating the optimal filter by linearization: the EKF . . .	43
2.5. Approximating the optimal filter by discretization: the Sigma-Points Kalman Filter	45
2.5.1. Prediction and sigma points	45
2.5.2. Interpretation of the sigma-point approach	46
2.5.3. Scaled UKF	50
2.6. Invariant observer theory	53
2.6.1. Illustrative example: non-holonomic car	59
Chapter 3. Inertial Navigation Models	69
3.1. Preliminary remarks: modeling mini-UAVs	69
3.2. Derivation of the navigation model	72
3.3. The problem of “true” inertial navigation	75
3.4. Modeling and identifying the imperfections of inertial sensors .	79
3.4.1. Allan variance	80
3.4.2. Modeling characteristic noise	84
3.5. Inertial navigation on low budgets: AHRS	85
3.5.1. Observability of the underlying model of the AHRS	87
3.5.2. Returning to our AHRS: integrating a description of measurement errors	91
3.6. AHRS plus a GPS and a barometer: Inertial Navigation System	92
3.6.1. Observability of the imperfections in the measurements used by the INS	94
Chapter 4. The IUKF and π-IUKF Algorithms	97
4.1. Preliminary remarks	97
4.2. Organization of this chapter	98
4.3. Results from differential geometry: symmetries and invariant/equivariant systems	100
4.4. Invariant observers – AHRS/INS	102
4.4.1. AHRS: model summary	102
4.4.2. Invariance of the AHRS model equations	103
4.4.3. Constructing an output error and an invariant frame	105

4.4.4. Formulating the invariant observer for a low-budget AHRS	108
4.4.5. Invariant filter for the INS	109
4.4.6. Formulating the invariant observer for the INS	112
4.5. Invariant state estimation error	113
4.6. The SR-UKF algorithm	116
4.7. First reformulation of unscented Kalman filtering in an invariant setting: the IUKF algorithm	118
4.7.1. Foundational principles	118
4.7.2. Initial results and analysis	133
4.7.3. Summary and pseudocode	149
4.8. Second reformulation of unscented Kalman filtering in an invariant setting: the π -IUKF algorithm	152
4.8.1. Previous work on the IEKF algorithm	152
4.8.2. Formulation of the π -IUKF algorithm on a Lie group	155
Chapter 5. Methodological Validation, Experiments and Results	161
5.1. Validation with simulated data	162
5.1.1. Presentation of the data	162
5.1.2. Performance study of the two UKF algorithms on the AHRS model	166
5.1.3. Invariance properties of π -IUKF on the AHRS model	172
5.1.4. Performance study of the two UKF algorithms on the INS model	174
5.1.5. Invariance properties of π -IUKF on the INS model	181
5.2. Validation with real data	183
5.2.1. Tools and experimental setup	184
5.2.2. Preliminary identification of imperfections	187
5.2.3. Calibration procedure for the embedded sensors of the Apogee chip	191
5.2.4. Experimental implementation of the π -IUKF algorithm on the AHRS model	194

5.2.5. Validation of the INS with real data	197
5.2.6. Analysis of the velocity and position performance of the INS	201
5.3. Implementation of the invariant observer for the INS model . .	203
Conclusion and Outlook	207
Appendix	213
