Preface	xi
Chapter 1. Dynamic Plasticity: Dislocations.	1
1.1. Introduction: how to describe plasticity?	1
1.1.1. Equivalence between forming processes and mechanical tests	2
1.1.2. Early stages of strain	3
1.1.3. Multiplication of dislocations.	3
1.1.4. Fine-level observations (load–unload cycles) of the beginning of plasticization.	7
1.2. Strain speed: $\dot{\epsilon}$ ($\dot{\gamma}$ for shearing)	7
1.2.1. A few definitions and orders of magnitude.	7
1.2.2. Influence of the strain speed	9
1.2.3. The influence of the “history” of strain	11
1.2.4. Dynamic–dynamic speed jump.	14
1.3. The microstructural mechanisms of plasticity	16
1.3.1. Description of a dislocation and its line.	16
1.3.2. Dislocation types	17
1.3.3. Crystallographic slips	39
1.3.4. Twinning	53
1.3.5. Force on the dislocation	58
Chapter 2. Obstacles and Mechanisms of Crossings	59
2.1. Obstacles	60
2.2. Nature and resistance of obstacles	61
2.3. Example of measuring dislocation speeds	62

2.4. Microstructural mechanisms of the deformation rate	67
2.5. Mechanisms due to obstacles: hardening mechanisms	68
2.5.1. Obstacles to movement due to the dislocations themselves	69
2.5.2. Interactions with the forest	70
2.5.3. (Simplified) analysis of the consolidation due to the forest dislocation	71
2.5.4. Blockages of dislocations by pileups	74
2.5.5. Piling-up of dislocations.	75
2.5.6. Influence of grain size	77
2.5.7. The case of nanomaterials (very small grain size): mechanical strength and hardness (T less than $0.3 T_f$)	81
2.5.8. Influence of vacancies	84
2.5.9. Vacancies and dislocations	85
2.5.10. Stacking and twinning faults	86
2.5.11. Lomer–Cottrell barriers	91
2.5.12. Influence of obstacles associated with alloy elements and impurities	94
2.5.13. Anchoring dislocations.	95
2.5.14. Formation of loops around particles	97
2.5.15. Substitution and insertion of atoms.	98
2.5.16. Evolution of the stress due to the added elements	98
2.5.17. Hardening by precipitates	104
2.6. Athermal mechanism of the movement of a dislocation	116
2.6.1. Density ρ of dislocations and athermal stress	117
2.7. Thermally activated mechanism of the movement of a dislocation	122
2.7.1. Model of the behavior law	126
2.8. The viscous friction mechanism.	129
2.8.1. Influence of viscosity η of the medium on the viscous damping coefficient B	134
Chapter 3. Dynamic Flows for Monocrystals and Polycrystals	137
3.1. Type of monocrystal and polycrystal dynamic shear test samples (anisotropy and isotropy at high speeds)	138
3.2. The tensor of the shock stresses	139
3.3. Study of strain on a polycrystal	140
3.4. Dynamic flows by electromagnetic shocks, polycrystalline aluminum A5	140
3.5. The case of six polycrystals	142

3.6. The case of monocrystals.	143
3.6.1. Flow of a crystal	144
3.7. Models for CFCs.	147
3.7.1. Viscoplastic dynamic flows of crystals: the case of aluminum ($\dot{\epsilon} \approx 10^4 \text{ s}^{-1}$).	149
3.8. Dynamics of flows shown using an ultra-fast camera	152
3.8.1. Dynamics of shear shocks.	153
3.9. Viscoplasticity	161
3.9.1. Influence of phonic and electronic viscous friction: the case of lead	163
3.9.2. Viscoplasticity of metal crystals: influence of viscous friction	167
3.10. References for viscoplasticity	170
Chapter 4. Limits to Static and Dynamic Formability.	173
4.1. Plastic instability.	173
4.1.1. Necking.	173
4.1.2. Work hardening coefficient n	175
4.1.3. Instabilities studies (including speed effect $\dot{\epsilon}$)	175
4.1.4. Role of the strain speed	177
4.1.5. Summary.	179
4.1.6. Generalized strain speed.	180
4.2. Forming by pressing	181
4.2.1. Study of plastic instability; influence of work hardening and anisotropy (characteristics of pressing thin sheets)	181
4.2.2. Parameters influencing instability: influences of the work hardening n and the anisotropy r	185
4.2.3. Pressing and formability in bending of sheets, shaping of elliptical bulbs	189
4.3. Damage: area between necking and fracture, the case between Forming Limit Curves (FLCs) and Fracture Forming Limit Curves (FFLCs).	190
4.3.1. Definition	190
4.3.2. Damage measurement D	191
4.3.3. Large strains and damage	194
4.3.4. Stress curve, strain of a 30 CD4 steel that has undergone a perlite globularization annealing (as given by Gathouffi (1984))	195
4.4. Limit of the formability during necking (FLCs) and during fracture (FFLCs): influence of the strain rate.	196

4.4.1. Types of strain.	197
4.4.2. Comparison of FLC by $\dot{\epsilon}$: shock by electronic action in the case of aluminum alloys.	201
4.4.3. Influence of strain rates on FLCs: static and dynamic formability.	204
4.4.4. Metals studied.	206
4.4.5. Strain trajectories: change of ϵ_1 under ϵ_2 ; comparison of low and high speeds	207
4.4.6. Comparison of the values for necking Z and fracture R	210
4.4.7. Change in necking	210
4.4.8. Change in fracture	213
4.4.9. Change between necking and fracture.	215
4.4.10. Examples in magnetofforming and electro-hydroforming.	216
Chapter 5. Dynamic Resistance to Mechanical Shocks	219
5.1. Shock stresses	219
5.1.1. Energy aspects: momentum, kinetic energy, impulse.	219
5.1.2. Comparison between stress levels in static and dynamic loads	221
5.2. Resilience test	227
5.2.1. Impact by a simple pendulum.	227
5.2.2. Stress from polar shock impacts	232
5.2.3. Shock with rebound, coefficient of restitution, energy losses	237
5.2.4. Effect of resistance to movement, speed and stress upon impact	239
5.2.5. Resistant force proportional to the square of the instantaneous speed v^2	242
5.2.6. Elastoplastic resistance to impact and deformation of a solid	247
5.3. Typical loads, stress waves	251
5.3.1. Longitudinal compression waves, mechanical impedance, stress.	252
5.3.2. Wave step diagram	255
5.4. Dynamic tests, Hopkinson technique, laws of behavior.	264
5.4.1. Principle of dynamic tests with Hopkinson bars.	264
5.4.2. Measurement of strain by extensometry gauges.	267
5.4.3. Data acquisition.	270
5.4.4. Data processing: analysis of dynamic behavior tests of materials	273
5.4.5. Dynamic tension and torsion	278
5.4.6. Dynamic shear of monocrystals and polycrystals	280

Appendix A. Primary Times of Mechanisms	289
