Foreword xiii
Félix DARVE

Introduction xv

Chapter 1. Multi-Scale and Multi-Physics Modeling of the Contact Interface Using DEM and Coupled DEM-FEM Approach 1
Mohamed GUESSASMA, Valery BOURNY, Hamza HADDAD, Charles MACHADO, Eddy CHEVALLIER, Aymen TEKAYA, Willy LECLERC, Robert BOUZERAR, Khaled BOURBATACHE, Christine PÉLEGRIS, Emmanuel BELLENGER and Jérôme FORTIN

1.1. Introduction. 1
1.2. Modeling of mutlicontact systems using DEM for electrical transfer applications 2
1.2.1. Diagnosis of defects in ball bearings 4
1.2.2. Monitoring of the ring/wire contact interface in wind plants 8
1.3. DEM for modeling continuous media 12
1.3.1. Effective mechanical properties of heterogeneous materials: application to composite materials. 13
1.3.2. Thermal transfer by conduction in continuous materials: application to contact interfaces 18
1.4. DEM–FEM-based approach for multi-scale and multi-physics modeling 21
1.4.1. Thermomechanical multi-scale modeling. 23
1.4.2. Thermomechanical resolution in multicontact interface 24
1.5. Conclusion 27
1.6. Acknowledgments. 28
1.7. Bibliography 28

Chapter 2. Adsorption-induced Instantaneous Deformation in Double Porosity Media: Modeling and Experimental Validations 33
Laurent PERRIER, Frédéric PLANTIER, Gilles PIJAUDIER-CABOT and David GREGOIRE

2.1. Introduction 34
2.2. An incremental poromechanical framework with varying porosity for single porosity media 37
2.2.1. Modeling procedure 37
2.2.2. Validation by experimental comparisons on a single porosity bituminous coal from the literature 40
2.3. Extension of the poromechanical framework to double porosity media 43
2.4. A new experimental set-up allowing the simultaneous *in situ* measurements of both adsorption and swelling 47
2.4.1. Gas adsorption measurements 48
2.4.2. Swelling measurement by DIC 48
2.5. Validation of the extended poromechanical model by experimental comparisons on a double porosity synthetic activated carbon 51
2.6. Concluding remarks and perspectives 54
2.7. Acknowledgments 56
2.8. Bibliography 56

Chapter 3. Granular Materials: Mesoscale Structures and Modeling 61
Zhu HUAXIANG, Hélène MAGOARIEC, Eric VINCENS, François NICOT, Bernard CAMBOU and Félix DARVE

3.1. Introduction 61
3.2. Mesoscale as a basis for upscaling the mechanical behavior of granular materials 62
3.2.1. Numerical simulation of a 2D cyclic biaxial test 62
3.2.2. Mesoscale and mesovariables: definitions 64
3.2.3. Evolution of the mesostructure throughout loading and unloading 69
3.2.4. Analysis of mesostress and mesostrain of the different phases throughout loading and unloading stages. 71
3.2.5. Relevance of the mesovariables and the chosen upscaling technique of the mechanical behavior 74
3.3. Multi-scale constitutive model including mesostructures 77
3.3.1. Brief review of the microdirectional model 77

3.3.2. Fabric evolution in the mesoscale 79
3.3.3. H-directional model 85
3.4. Conclusion 89
3.5. Bibliography 90

Chapter 4. Behavior of Granular Materials Affected by Grain Breakage 95
Christophe DANO, Carlos OVALLE, Zhen-Yu YIN, Ali DAOUADJI and Pierre-Yves HICHER

4.1. Introduction. 95
4.2. Size effects in rockfill materials. 96
4.2.1. Micro and macro-scale effects 96
4.2.2. Theoretical developments 98
4.2.3. Experimental validation 99
4.3. Challenges in modeling rockfill behavior 101
4.3.1. Experimental investigation on critical state characteristics 105
4.3.2. Elasto-plastic models with an implicit description of GSD evolution 109
4.3.3. Explicit description of GSD evolution 112
4.4. Detrimental effect of humid conditions on grain breakage 118
4.5. Conclusion 126
4.6. Acknowledgements 126
4.7. Bibliography 127

Chapter 5. Multi-scale Modeling of the Mechanical Behaviour of Clays 133
Zhen-Yu YIN and Pierre-Yves HICHER

5.1. Introduction. 133
5.2. Experimental investigation on clayey microstructure 134
5.3. Development of micromechanics-based model for clay. 137
5.3.1. Density state of an aggregate assembly 137
5.3.2. Inter-aggregate behavior. 138
5.3.3. Stress-strain relationship. 142
5.3.4. Summary of parameters 146
5.3.5. Experimental verification 147
5.4. Mobilized three-dimensional strength criteria 148
5.5. Induced anisotropy effects obtained by the micromechanical model . . 149
5.5.1. Stress path dependent behavior. 150
5.5.2. Rotational hardening of the yield surface. 151
5.6. Inherent anisotropy in the micromechanical model 153
5.6.1. Formulation of general anisotropy. 154
5.6.2. Inherent anisotropy of friction angle and stiffness 155

5.7. Cyclic loading effect by the micromechanical model 157
5.7.1. Stress reversal at contact level 158
5.7.2. Cyclic behavior under drained condition 159
5.7.3. Cyclic behavior under undrained condition 160
5.8. Comments on possible model extension 161
5.8.1. Model extension for sensitive clays 162
5.8.2. Simulations of triaxial tests on sensitive clay 163
5.9. Conclusion 164
5.10. Acknowledgements 165
5.11. Bibliography 165

Chapter 6. Modeling of Complex Microcracking in Quasi-Brittle Materials: Numerical Methods and Experimental Validations 171
Thanh Tung NGUYEN, Julien YVONNET, Michel BORNERT and Camille CHATEAU

6.1. Introduction 171
6.2. Experimental procedures 174
6.2.1. Description of the tested samples 174
6.2.2. Description of the *in situ* compressive test 175
6.2.3. XR-μCT imaging and DVC 177
6.2.4. Detection of damage from DVC-assisted image subtraction and image transformation 178
6.3. Numerical simulation methods 180
6.3.1. A phase field method for voxel-based models 180
6.3.2. An extension of the phase field method to interfacial damage . . . 185
6.4. Validations of crack propagation 188
6.4.1. 2D validations 188
6.4.2. 3D validations 191
6.5. Conclusion 197
6.6. Bibliography 199

Chapter 7. Multi-Scale Methods for the Analysis of Creep-Damage Coupling in Concrete 205
Mounia FARAH, Jacqueline SALIBA, Frédéric GRONDIN and Ahmed LOUKILI

7.1. Introduction 205
7.2. Experimental methods for the identification of creep-damage coupling in concrete 207
7.2.1. State-of-the-art of creep analysis of cementitious materials 207
7.2.2. Measurement of the residual strength of concrete after creep 208
7.2.3. AE monitoring of creep tests for concrete and mortar beams 212
7.2.4. Summary 215
7.3. Numerical methods for the analysis of damage during creep 215
7.3.1. State-of-the-art of the creep modeling of cement-based materials . 215

7.3.2. Creep-damage modeling 217
7.3.3. A predictive creep modeling 226
7.4. Conclusion 235
7.5. Bibliography 236

Chapter 8. Effect of Variability of Porous Media Properties on Drying Kinetics: Application to Cement-based Materials 243
Nabil ISSAADI, Abdelkarim Aït-MOKHTAR, Rafik BELARBI and Ameur HAMAMI

8.1. Introduction 243
8.2. Heterogeneous and variable nature of porous building materials 244
8.2.1. General definitions 244
8.3. Hygrothermal transfer properties in porous media: case of cement based materials 247
8.3.1. Porosity 247
8.3.2. Water Vapor Adsorption Desorption Isotherm 248
8.3.3. Water vapor permeability and moisture diffusion coefficient 251
8.3.4. Gas permeability 255
8.4. Most commonly used models for hygrothermal transfers 258
8.4.1. Philip and De Vries model (1957) 258
8.4.2. Luikov model (1966) 259
8.4.3. Other models 261
8.5. Variability effect of the moisture diffusion coefficient and the saturation water content on drying kinetics 262
8.5.1. Problematic 262
8.5.2. Pseudo random variability of the moisture diffusion coefficient . . 264
8.5.3. Variability of the saturation water content 266
8.6. Assessment and incidence of the spatial variability of the porous medium properties on the hygrothermal transfer at a wall scale 270
8.6.1. Assessment of the spatial variability: example of a concrete wall 270
8.6.2. Assessing the correlation length 276
8.6.3. Methodology on integration of the spatial variability properties in assessing the behavior of porous media 278
8.6.4. Application to hygrothermal transfer simulation at a wall scale (deterministic and probabilistic approach) 282
8.7. Conclusion 285
8.8. Bibliography 286

Chapter 9. State of the Art on the Likelihood of Internal Erosion of Dams and Levees by Means of Testing 291
Pierre-Yves HICHER, Didier MAROT and Luc SIBILLE

9.1. Introduction 291
9.2. Experimental findings on interface erosion 291
9.2.1. Introduction 291
9.2.2. Comparative analysis of interface erosion tests 293
9.2.3. Interpretation by energy method 293
9.2.4. Statistical analysis 296
9.3. Experimental findings on suffusion. 297
9.3.1. A mechanics-based understanding of suffusion 297
9.3.2. General principle of laboratory suffusion test apparatus 298
9.3.3. Parametric studies 301
9.3.4. Characterizing suffusion susceptibility 302
9.4. A description of internal erosion based on flow power 306
9.4.1. Detachment of solid particles / initiation of erosion 306
9.4.2. Description of internal erosion including a filtration step 314
9.5. Numerical approaches to describing internal erosion effects in soils . . 317
9.5.1. DEM approach 317
9.5.2. Micromechanical approach 321
9.5.3. Comparison between numerical results from DEM and micromechanical model 327
9.5.4. Conclusion 329
9.6. General conclusion 330
9.7. Bibliography 330

Chapter 10. Mechanical Stability of River Banks Submitted to Fluctuations of the Water Level 335
Sambath KY, Juan MARTINEZ and Soksan CHUN

10.1. Introduction 335
10.2. Background and general methods of analysis 336
10.2.1. Flow regimes and fluvial morphology 336
10.2.2. Seepage analysis. 339
10.2.3. Stability analysis 341
10.3. A built-in model for bank stability analysis 341
10.3.1. Groundwater seepage model 342
10.3.2. Erosion model 344
10.3.3. Mass stability model 345
10.3.4. Validation of MEStab code by comparison to finite element results 346
10.3.5. Coupling erosion with seepage and mass slide 349
10.4. Application to the Lower Mekong Basin. 349

10.4.1. Seasonal River Flow Regime 350
10.4.2. Observed changes in the Mekong River morphology 350
10.4.3. Case study of the stability of a river bank at Kampong Cham . . . 352
10.5. Conclusions and perspectives 357
10.6. Bibliography 358
