Foreword	ix
Michel FEIDT	
Preface	xi
Jocelyn BONJOUR	
Chapter 1. Heating and Cooling by Reverse Cycle Engines: State of the Art	1
Philippe HABERSCHILL and Rémi REVELLIN	
1.1. Vapor compression refrigerators and heat pumps.	2
1.1.1. Operation principle of closed-circuit refrigeration installation: definitions	2
1.1.2. Actual cycle with superheating and subcooling	5
1.1.3. Special cycles	6
1.1.4. Heat output settings.	20
1.2. Systems driven by thermal energy	21
1.2.1. Principle of thermodynamic operation	21
1.2.2. Absorption chillers	22
1.2.3. Ejection machines.	38
1.3. References	44
Chapter 2. Entropy and Exergy Analyses Applied to Reverse Cycles	45
Jocelyn BONJOUR and Rémi REVELLIN	
2.1. Definition of the study system and objectives.	45
2.2. Energy analysis	48
2.2.1. Steady-state system-wide analyses	49
2.2.2. A system-wide analysis: power or energy?	51
2.2.3. Component-scale energy analysis	52
2.3. Entropy analysis	62
2.3.1. Second law of thermodynamics: an entropic power balance	63
2.3.2. Reversible upper limit: Carnot engines	63

2.3.3. Component-scale entropy analysis	72
2.3.4. Phenomenon-scale entropy analysis: two-phase flows with heat transfer and phase change.	78
2.4. Exergy analysis	82
2.4.1. From the concept of exergy to proposed definitions	82
2.4.2. Mathematical definitions of exergy	83
2.4.3. Exergy analysis of reverse cycle engines	85
2.5. Case study for exergy analysis	88
2.5.1. Refrigerator with cooled compression and recovery of heat rejected.	88
2.5.2. Heat pump running on CO ₂ with or without an ejector	90
2.6. References	92
Chapter 3. Thermodynamics and Optimization of Reverse Cycle Engines	93
Michel FEIDT	
3.1. Reverse cycle engines according to equilibrium thermodynamics: reminders of the concepts	93
3.2. Receiving engines in the presence of internal irreversibilities	95
3.3. The Carnot refrigerator according to finite-time thermodynamics	96
3.4. The reverse cycle Carnot engine model according to finite physical dimensions thermodynamics (FPDT)	98
3.4.1. Model of a Carnot engine with thermal conductances	98
3.4.2. Immediate extensions of the model with thermal conductances	102
3.5. Generalization of the reverse cycle Carnot engine model according to FPDT	104
3.6. Latest advances in a reverse cycle Carnot engine model	106
3.6.1. Energy model	106
3.6.2. Minimizing the energy expenditure of the Carnot refrigerator (power)	107
3.6.3. The modified Chambadal refrigerator.	108
3.6.4. The modified Curzon–Ahlborn refrigerator	110
3.7. Extension of finite physical dimensions thermodynamics to two complex systems	112
3.7.1. Complex two-reservoir systems	112
3.7.2. Some comments on reverse cycle engines with three and four reservoirs	116
3.8. Some conclusions and perspectives	119
3.9. References	119
Chapter 4. Scientific and Technological Challenges of Thermal Compression Refrigerating Systems.	121
Florine GIRAUD, Romuald RULLIÈRE and Jocelyn BONJOUR	
4.1. Introduction	121
4.2. Kinetics and dynamics – heat and mass transfers in thermal compression engines	122

4.2.1. Absorption theory and design elements of absorbers	123
4.2.2. Adsorption theory and dimensioning elements of adsorbers and reverse cycle adsorption engines.	130
4.2.3. Issues associated with transfer kinetics and resistance.	135
4.3. Technological challenges in component design.	138
4.3.1. Fluid pair	138
4.3.2. Absorber	139
4.3.3. Adsorber	143
4.3.4. Evaporator	151
4.3.5. Coupling of components: the evapo-absorber	156
4.4. Risks associated with liquid–solid phase transition phenomena	160
4.4.1. Crystallization.	160
4.4.2. Freezing	162
4.5. Conclusion	163
4.6. References	164
Chapter 5. Magnetocaloric Refrigeration: Principle and Applications . . .	171
Monica SIROUX	
5.1. Introduction	171
5.2. Magnetic refrigeration.	172
5.2.1. Overview	172
5.2.2. The magnetocaloric effect	174
5.2.3. Magneto-thermodynamic cycles.	176
5.2.4. Magnetocaloric materials.	182
5.3. Numerical models	186
5.3.1. Numerical models of magnetocaloric regenerators	186
5.3.2. Recent numerical models.	189
5.4. Applications	194
5.4.1. Prototypes	194
5.4.2. Future applications	201
5.5. Conclusion	204
5.6. References	204
Chapter 6. Thermoelectric Systems as an Alternative to Reverse Cycle Engines	209
Julien RAMOUSSE and Stéphane PAILHÈS	
6.1. Thermoelectricity fundamentals	211
6.1.1. Transport of charge and heat.	213
6.1.2. Thermoelectric effects	220
6.1.3. Main lines of research	229
6.2. Implementation and performance analysis	236
6.2.1. Implementation of thermoelectric modules.	237

6.2.2. Performance analysis of thermoelectric modules	238
6.2.3. Intrinsic performance of thermoelectric systems	240
6.2.4. Optimal module design	244
6.2.5. Overall performance of thermoelectric systems	245
6.2.6. Thermodynamic analysis of irreversibilities	247
6.2.7. Integration and management	250
6.3. Applications	251
6.3.1. Cooling of electronic and optical components	251
6.3.2. Domestic refrigerator	252
6.3.3. Building applications: air conditioning, room cooling.	253
6.3.4. Automotive cooling.	253
6.3.5. Autonomous solar cooling	253
6.4. References	254
List of Authors	263
Index.	265
