Preface	xi
Chapter 1. Dynamic Behavior of Concrete: Experimental Aspects	1
François TOUTLEMONDE and Gérard GARY	
1.1. Introduction.	1
1.1.1. Meaning of the word “dynamic”.	1
1.1.2. Reminders about dynamic experimentation	3
1.1.3. Identifying the behavior of concrete under fast dynamic loadings	8
1.2. Tests in which the transient rate has little influence	10
1.2.1. Tests involving deviatoric behavior	11
1.2.2. Tests with prevailing spherical behavior	17
1.3. Tests with transient phase conditioned interpretations	20
1.3.1. Tests involving mainly traction behavior	20
1.3.2. Tests implementing compression behavior	25
1.4. Other tests.	29
1.4.1. Tests adaptable to an energetic approach	29
1.4.2. Validation tests on structures requiring an inverse analysis	30
1.5. Synthesis of the experimental data on concrete and associated materials	33
1.5.1. Data on cement paste mortar and concrete	33
1.5.2. Data available for reinforced concrete.	40
1.5.3. Data about fiber-reinforced concretes	42
1.6. Conclusion	46
1.7. Bibliography	47
Chapter 2. Dynamic Behavior of Concrete: Constitutive Models	55
Patrice BAILLY	
2.1. Dynamics of concrete structures	55
2.1.1. Macroscopic phenomena	55
2.1.2. Perforation	57

2.1.3. Ejection of fragments	58
2.1.4. Loading range	59
2.1.5. Loading path.	60
2.2. Fast dynamics applied to concrete	62
2.2.1. Impacts and waves	62
2.2.2. Impact and shock polar curve.	66
2.2.3. Shock between two solids.	67
2.3. Scabbing	68
2.4. Effect of a shock wave on the structure of materials.	69
2.5. Modeling types.	70
2.5.1. Behavior description theoretical frames.	70
2.5.2. Integrating sensitivity to the strain rate	71
2.5.3. Elasto-plasticity and criteria	72
2.5.4. Damage.	74
2.5.5. Notion of a state law	74
2.5.6. Location limiter and time sensitivity	75
2.6. Models.	76
2.6.1. Elasticity-based model.	76
2.6.2. Models based on the theory of plasticity	77
2.6.3. Models based on damage mechanics	81
2.6.4. Model coupling damage and plasticity	82
2.6.5. Model coupling damage and mechanics of porous media	83
2.6.6. Model deriving from a hydrodynamic approach.	84
2.6.7. Endochronic models	87
2.6.8. Discrete element method	88
2.7. Conclusion	90
2.7.1. Main features of the models.	90
2.7.2. Contribution of distinct elements.	91
2.8. Bibliography	92
Chapter 3. Seismic Ground Motion	95
Pierre-Yves BARD	
3.1. Introduction.	95
3.2. Measuring seismic motions	96
3.2.1. Differences between seismological and accelerometer networks	96
3.2.2. Accelerometer networks.	97
3.2.3. Accelerometer data banks.	98
3.3. Quantitative characterization of seismic movements	98
3.3.1. Time maximum values.	98
3.3.2. Spectral characterizations	99
3.3.3. Features of hybrid characterizations.	106
3.3.4. Caveats regarding differential motions	107
3.4. Factors affecting seismic motions.	108
3.4.1. Spectral signature of the seismic source	109
3.4.2. Effects of propagation in the Earth's crust	111

3.4.3. Site effects	113
3.5. Conclusions	120
3.6. Bibliography	121
Chapter 4. Soil Behavior: Dynamic Soil-Structure Interactions	125
Alain PECKER	
Introduction	125
4.1. Behavior of soils under seismic loading	126
4.1.1. Influence of the nature of soils on seismic movements	126
4.1.2. Experimental description of soil behavior	128
4.2. Modeling soil behavior	131
4.2.1. An experimental description of elastic soil behavior ($\gamma \leq \gamma_s$)	134
4.2.2. Linear visco-elastic models for medium strain domains where $\gamma_s \leq \gamma \leq \gamma_v$	134
4.2.3. High strain domain non-linear models where $\gamma \geq \gamma_v$	141
4.3. Linear soil-structure interactions	143
4.3.1. Illustration of the soil-structure interaction effect	143
4.3.2. Expression of a soil-structure problem	148
4.3.3. Superposition theorem	151
4.3.4. Practical modeling of the soil-structure interaction	154
4.4. Non-linear soil-structure interactions	158
4.4.1. Geometric non-linearities and uplift of the foundations	158
4.4.2. Non-linearities of behavior	158
4.4.3. Modeling the non-linear soil-structure interaction	159
4.5. Bibliography	161
Chapter 5. Experimental Methods in Earthquake Engineering	165
Alain MILLARD, Pierre PEGON and Jean-Claude QUEVAL	
Introduction	165
5.1. The pseudo-dynamic method	167
5.1.1. Introduction	167
5.1.2. History of the PSD method	168
5.1.3. The ELSA laboratory	168
5.1.4. Comparison with shaking tables	170
5.2. The conventional pseudo-dynamic method	170
5.2.1. Algorithms	170
5.2.2. Implementation at ELSA	172
5.2.3. The sub-structuration method	174
5.2.4. Illustration	177
5.3. Continuous pseudo-dynamic method	178
5.3.1. Continuous method principle	178
5.3.2. Implementation at ELSA	180
5.3.3. Sub-structuration for the continuous method	182
5.4. Final comments	183

5.5. Shaking table tests	184
5.5.1. Introduction	184
5.5.2. Characteristics and performance of shaking tables	187
5.6. Laws of similarity	193
5.7. Instrumentation	194
5.8. Loading	195
5.9. Conclusion	196
5.10. Bibliography	197
Chapter 6. Experiments on Large Structures	201
Patrick PAULTRE and Jean PROULX	
Introduction	201
6.1. Instrumentation	202
6.2. Dynamic loads	205
6.3. Data processing	206
6.4. Application to buildings	208
6.4.1. The slanting tower at the Montreal Olympic Stadium	209
6.4.2. Reinforced concrete building	210
6.5. Bridge application	213
6.5.1. Pedestrian footbridge.	213
6.5.2. A mixed cable-stayed/suspension bridge	215
6.6. Application to large dams	220
6.6.1. Assessment of a response spectrum on the crown.	220
6.6.2. Study of foundation-ice-reservoir-dam interactions.	222
6.6.3. Study of the effect of the water level inside the reservoirs.	228
6.7. Conclusion	230
6.8. Acknowledgements	230
6.9. Bibliography	230
Chapter 7. Models for Simulating the Seismic Response of Concrete Structures	233
Didier COMBESURE, Nicolas ILE, Jacky MAZARS and Jean-Marie REYNOUARD	
7.1. Introduction.	233
7.2. Different discretization families.	234
7.2.1. Global modeling	234
7.2.2. Semi-global modeling	235
7.2.3. 2D and 3D fine models	239
7.3. Behavior laws for concrete.	240
7.3.1. Semi-empirical mixed models	240
7.3.2. Damage model	241
7.3.3. Plasticity model for concrete	243
7.3.4. Cyclic models for steel.	247
7.3.5. Taking construction layouts and second-order phenomena into account	248

7.4. A few examples with their validation through experiments	250
7.4.1. Application of the semi-global method to a four-storey structure	250
7.4.2. Semi-global and local models applied to concrete walls	253
7.5. Conclusions.	269
7.6. Bibliography	270
Chapter 8. Seismic Analysis of Structures: Improvements Due to Probabilistic Concepts	273
Jean-René GIBERT	
8.1. Introduction.	273
8.2. The modal method.	274
8.2.1. Data about the seismic source	274
8.2.2. Calculation of structural responses using the modal method	277
8.3. Criticism of the modal method	279
8.4. A few reminders about random processes	280
8.4.1. Definition and characterization of a time random process	280
8.4.2. Second order characterization	280
8.4.3. Response of a linear system to random stress	282
8.4.4. Using stochastic equations	285
8.4.5. Extrema statistics in a stationary process	286
8.5. Improvements to the modal method	292
8.5.1. Complete quadratic combination.	294
8.5.2. Peak factor effect	295
8.6. Direct calculation of the floor spectra	297
8.6.1. Representation of non-stationary processes	297
8.6.2. Adjusting a separable process from the ORS data.	298
8.6.3. Determination of the floor spectra	299
8.7. Creation of synthetic signals and direct numerical integration.	301
8.8. Seismic analysis of non-linear behavior structures.	304
8.8.1. Introduction	304
8.8.2. Main non-linearities of seismically-loaded structures	304
8.8.3. Notion of “inelastic spectra”	305
8.8.4. Conventional method of stochastic linearization	310
8.8.5. Random parameter stochastic linearization.	316
8.9. Conclusion	323
8.10. Bibliography	323
Chapter 9. Engineering Know-How: Lessons from Earthquakes and Rules for Seismic Design	327
Philippe BISCH	
9.1. Introduction.	327
9.2. Lessons from earthquakes	327
9.2.1. Pathologies linked to overall behavior	328
9.2.2. Problems linked to local under-design	330

9.2.3. Problems linked to construction layout	334
9.3. The aims of anti-seismic protection standards	336
9.3.1. Standardization of anti-seismic design	336
9.3.2. Main objectives of anti-seismic protection	337
9.3.3. Verification method	338
9.3.4. Capacity-design method	341
9.4. General design	344
9.4.1. Design principles	344
9.4.2. Regularity conditions	345
9.4.3. Calculation of seismic action effects	346
9.5. Behavior coefficients	349
9.5.1. Using behavior coefficients	349
9.5.2. Structure behavior and behavior coefficients	351
9.5.3. Local ductility and behavior coefficients	352
9.5.4. Ductility classes and behavior coefficients	352
9.6. Designing and dimensioning reinforced concrete structure elements . .	353
9.6.1. Regulations specific to reinforced concrete in seismic areas	353
9.6.2. Main types of reinforced concrete bracing	354
9.6.3. Main frames	356
9.6.4. Reinforced concrete bracing walls	359
9.6.5. Detail designing	364
9.7. Conclusions	366
9.8. Bibliography	366
List of Authors	369
Index	373
