

Table of Contents

Preface	xi
Chapter 1. Mission and Environmental Data Processing	1
Amine JAAFAR, Bruno SARENI and Xavier ROBOAM	
1.1. Introduction	1
1.2. Considerations of the mission and environmental variables	3
1.2.1. Mission representation through a nominal operating point	4
1.2.2. Extraction of a “sizing” temporal chronogram	4
1.2.3. Representation of an environmental variable or mission resulting from statistical analysis	5
1.3. New approach for the characterization of a “representative mission”	6
1.3.1. Characterization indicators of the mission and environmental variables	7
1.3.2. Mission and environmental variables at the heart of the system: an eminently systemic bidirectional coupling	13
1.4. Classification of missions and environmental variables	16
1.4.1. Classification without <i>a priori</i> assumption on the number of classes	17
1.4.2. Mission classification for hybrid railway systems	18
1.5. Synthesis of mission and environmental variable profiles	21
1.5.1. Mission or environmental variable synthesis process	21
1.5.2. Elementary patterns for profile generation	23
1.5.3. Application to the compacting of a wind speed profile	24
1.6. From classification to simultaneous design by optimization of a hybrid traction chain	25
1.6.1. Modeling of the hybrid locomotive	27

1.6.2. Optimization model	30
1.6.3. Mission classification	32
1.6.4. Synthesis of representative missions	33
1.6.5. Simultaneous design by optimization	37
1.6.6. Design results comparison	38
1.7. Conclusion	39
1.8. Bibliography	41
Chapter 2. Analytical Sizing Models for Electrical Energy Systems Optimization	45
Christophe ESPANET, Daniel DEPERNET, Anne-Claire SAUTTER and Zhenwai WU	
2.1. Introduction	45
2.2. The problem of modeling for synthesis	46
2.2.1. Modeling for synthesis.	46
2.2.2. Analytical and numerical modeling	48
2.3. System decomposition and model structure	55
2.3.1. Advantage of decomposition	56
2.3.2. Application to the example of the hybrid series-parallel traction chain for the hybrid electrical heavy vehicle	58
2.4. General information about the modeling of the various possible components in an electrical energy system	60
2.5. Development of an electrical machine analytical model	61
2.5.1. The various physical fields of the model and the associated methods for solving them	62
2.5.2. Application to the example of a hybrid electrical heavy vehicle: modeling of a magnet surface-mounted synchronous machine	64
2.6. Development of an analytical static converter model	73
2.6.1. The various physical fields of the model and associated resolution methods.	73
2.6.2. Application to the example of a hybrid electrical heavy vehicle: modeling of inverters feeding synchronous machines.	75
2.7. Development of a mechanical transmission analytical model	82
2.7.1. The various physical fields of the model and associated resolution methods.	82
2.7.2. Application to the example of a hybrid electric heavy vehicle: modeling of the Ravigneaux gear set	83
2.8. Development of an analytical energy storage device model	91
2.9. Use of models for the optimum sizing of a system.	91
2.9.1. Introduction	91

2.9.2. Consideration of operating cycles	94
2.9.3. Independent component optimization	97
2.9.4. Simultaneous component optimization	100
2.10. Conclusions	102
2.11. Bibliography	103
Chapter 3. Simultaneous Design by Means of Evolutionary Computation	107
Bruno SARENI and Xavier ROBOAM	
3.1. Simultaneous design of energy systems	107
3.1.1. Introduction to simultaneous design	107
3.1.2. Simultaneous design by means of optimization	109
3.1.3. Problems relating to simultaneous design using optimization	110
3.2. Evolutionary algorithms and artificial evolution	113
3.2.2. Evolutionary algorithms principle	114
3.2.3. Key points of evolutionary algorithms	115
3.3. Consideration of multiple objectives	119
3.3.1. Pareto optimality	119
3.3.2. Multi-objective optimization methods	120
3.3.3. Multi-objective evolutionary algorithms	121
3.4. Consideration of design constraints	123
3.4.1. Single objective problem	123
3.4.2. Multi-objective problem	125
3.5. Integration of robustness into the simultaneous design process	126
3.5.1. Robust design	126
3.5.2. Vicinity and uncertainty	127
3.5.3. Characterization of robustness	128
3.6. Example applications	130
3.6.1. Design of a passive wind turbine system	130
3.6.2. Simultaneous design of an autonomous hybrid locomotive	143
3.7. Conclusions	150
3.8. Bibliography	151
Chapter 4. Multi-Level Design Approaches for Electro-Mechanical Systems Optimization	155
Stéphane BRISSET, Frédéric GILLON and Pascal BROCHET	
4.1. Introduction	155
4.2. Multi-level approaches	156
4.3. Optimization using models with different granularities	160
4.3.1. Principle of SM	162
4.3.2. Mathematical example	164

4.3.3. SM variants	166
4.3.4. Safety transformer application	172
4.4. Hierarchical decomposition of an optimization problem	178
4.4.1. Target cascading for optimal design.	178
4.4.2. Formulation of the TC method	180
4.4.3. Mathematical example.	183
4.4.4. Railway traction engine example.	186
4.5. Conclusion	187
4.6. Bibliography	188
Chapter 5. Multi-criteria Design and Optimization Tools	193
Benoit DELINCHANT, Laurence ESTRABAUD, Laurent GERBAUD and	
Frédéric WURTZ	
5.1. The CADES framework: example of a new tools approach	194
5.2. The system approach: a break from standard tools.	195
5.2.1. Some component definitions	196
5.2.2. From integrated environments to collaborative tool frameworks	197
5.2.3. A centered model canvas: from generation to utilization.	198
5.2.4. Some “business” application frameworks	201
5.3. Components ensuring interoperability around a framework	203
5.3.1. Model types: white box, black box	203
5.3.2. Black boxes: positive collaboration and re-use	205
5.3.3. Object, component, and service paradigms.	206
5.3.4. ICAr software components: model normalization for sizing	209
5.4. Some calculation modeling formalisms for optimization	210
5.4.1. Analytical formalisms: algebraic and algorithmic.	210
5.4.2. Physical models within various formalisms	213
5.4.3. The generation chain	218
5.5. The principles of automatic Jacobian generation.	218
5.5.1. The Jacobian: complementary data for the model.	218
5.5.2. Derivation of mathematical expressions	219
5.5.3. Algorithm derivation.	221
5.5.4. Derivation of specific formulations	222
5.6. Services using models and their Jacobian	223
5.6.1. Sensitivity study	223
5.6.2. Composition of models	224
5.6.3. Optimal design	226
5.7. Applications of CADES in system optimization.	227
5.7.1. Overall optimization of a structure.	227
5.7.2. Evaluation of the potential of a structure	229
5.7.3. Comparison between structures	230

5.8. Perspectives	231
5.8.1. Towards optimization using dynamic modeling	231
5.8.2. Towards robust design	233
5.8.3. Robust optimization under reliability constraints	234
5.8.4. Towards the Internet	235
5.9. Conclusions	238
5.10. Bibliography	239
Chapter 6. Technico-economic Optimization of Energy Networks	247
Guillaume SANDOU, Philippe DESSANTE, Marc PETIT and Henri BORSENBERGER	
6.1. Introduction	247
6.2. Energy network modeling	249
6.2.1. Context	249
6.2.2. Notations	249
6.2.3. Objective function	250
6.2.4. Constraints	251
6.2.5. Expression of the problem and eventual linear reformulation	253
6.2.6. Position of the problem processed relative to the problem of energy network management	254
6.3. Resolution of the energy network optimization problem for a deterministic case	255
6.3.1. State of the art	255
6.3.2. Resolution by dynamic programming and Lagrangian relaxation	257
6.3.3. Resolution by genetic algorithm	262
6.4. Introduction to uncertainty consideration	266
6.4.1. Consideration of uncertainties	266
6.4.2. Recourse notion	267
6.5. Consideration of uncertainties on consumer demand	269
6.5.1. Safety margin	269
6.5.2. Scenario tree uncertainty modeling	269
6.5.3. Resolution by dynamic programming and Lagrangian relaxation	270
6.5.4. Conclusion	272
6.6. Consideration of uncertainties over production costs	273
6.6.1. Introduction	273
6.6.2. Mathematical formulation	274
6.6.3. Resolution	275
6.6.4. Example	277
6.7. From optimization to control	279
6.7.1. The predictive approach principle	279

x Integrated Design

6.7.2. Example	279
6.8. Conclusions	280
6.9. Bibliography	281
List of Authors	287
Index	291
