

Table of Contents

Preface	xi
Slim HAMMADI and Mekki KSOURI	
Chapter 1. Dynamic Car-pooling	1
Slim HAMMADI and Nawel ZANGAR	
1.1. Introduction	1
1.2. State of the art	2
1.3. Complexity of the optimized dynamic car-pooling problem: comparison and similarities with other existing systems	8
1.3.1. Graphical modeling for the implementation of a distributed physical architecture	9
1.3.2. Collection of requests for car-pooling and data modeling	11
1.3.3. Matrix structure to collect information on requests ..	14
1.3.4. Matrix representation for modeling car-pooling offers	17
1.3.5. Modeling constraints of vehicles' allocation to users .	21
1.3.6. Geographical network subdivision served and implementation of a physical distributed dynamic architecture	26
1.4. ODCCA: an optimized dynamic car-pooling platform based on communicating agents	33
1.4.1. Multi-agent concept for a distributed car-pooling system.	33

1.5. Formal modeling: for an optimized and efficient allocation method	40
1.5.1. Dijkstra Dynamic Distributed Algorithm	40
1.5.2. ODAVe: Optimized Distributed Allocation of Vehicle to users	44
1.6. Implementation and deployment of a dynamic car-pooling service	47
1.6.1. Deployment of ODCCA: choosing a hybrid architecture	49
1.6.2. Layered architecture	51
1.6.3. Testing and implementation scenario.	55
1.7. Conclusion.	65
1.8. Bibliography	66
Chapter 2. Simulation of Urban Transport Systems	71
Christian TAHON, Thérèse BONTE and Alain GIBAUD	
2.1. Introduction	71
2.2. Context	72
2.3. Simulation of urban transport systems	75
2.3.1. Non-guided transport systems	76
2.3.2. Guided transport systems	77
2.4. The types of modeling	80
2.4.1. Nature of the models	80
2.4.2. Macrosimulation, mesoscopic simulation, micro simulation.	81
2.5. Modeling approaches	83
2.6. Fields of application.	83
2.7. Software tools.	86
2.8. Simulation of the Valenciennes transport network with QUEST software.	87
2.8.1. Problem	87
2.8.2. Network operation in normal mode.	87
2.8.3. Disturbed mode network function.	90
2.9. The QUEST software	92
2.9.1. Presentation	92
2.9.2. Modeling	92
2.10. Network modeling in normal mode	94
2.10.1. Topology of traffic networks	94
2.10.2. Bus lines.	95
2.10.3. Vehicles	96
2.10.4. Modeling	96

2.10.5. Stops	97
2.10.6. Passengers	101
2.10.7. The flow of connecting passengers	102
2.11. Network modeling in degraded mode	103
2.11.1. Disturbances.	103
2.11.2. Regulatory procedures	105
2.12. Simulation results	107
2.13. Conclusion/perspectives.	107
2.14. Self-organization of traffic – the FORESEE simulator. .	108
2.14.1. General problem	108
2.14.2. FORESEE simulator	113
2.14.3. Results	117
2.15. Conclusion – perspectives.	124
2.15.1. Sustainability of the information	125
2.15.2. Information aggregation algorithms	125
2.15.3. Cooperation efficiency	125
2.15.4. Deployment of the proposed approach	126
2.16. Bibliography	127
Chapter 3.Real-time Fleet Management: Typology and Methods	139
Frédéric SEMET and Gilles GONCALVES	
3.1. Introduction	139
3.2. General context of RTFMP.	140
3.2.1. RTFMP characteristics	140
3.2.2. Application field of RTFMPs.	142
3.3. Simulation platform for real-time fleet management. . .	144
3.3.1. Dynamic management of vehicle routing	144
3.3.2. Routing management under time window constraints	146
3.3.3. General architecture of the simulation platform . .	147
3.3.4. Consideration of uncertainties on requests.	151
3.3.5. Consideration of information linked to traffic . . .	156
3.4. Real-time fleet management: a case study	162
3.4.1. General architecture of the optimization engine . .	163
3.4.2. Itinerary calculation and length estimation . . .	164
3.4.3. The static route planning problem	165
3.4.4. Route planning and modification of the transport plan	166
3.5. Conclusion	168
3.6. Bibliography	168

Chapter 4. Solving the Problem of Dynamic Routes by Particle Swarm	173
Mostefa Redouane KHOUAHJIA, Laetitia JOURDAN and El Ghazali TALBI	
4.1. Introduction	173
4.2. Vehicle routing problems	174
4.2.1. The static vehicle routing problem	174
4.2.2. The dynamic vehicle routing problem (DVRP)	176
4.2.3. Importance of dynamic routing problems	178
4.3. Resolution scheme of the dynamic vehicle routing problem	179
4.3.1. Event planner	179
4.3.2. Particle swarm optimization	181
4.4. Adaptation of the PSO metaheuristic for the dynamic vehicle routing problem	184
4.4.1. Representation of particles	184
4.4.2. Velocity and movement of particles	185
4.4.3. The APSO algorithm (Adaptive Particle Swarm Optimization)	187
4.4.4. Adaptive memory mechanism	188
4.5. Experimental results.	189
4.5.1. Datasets	189
4.5.2. Experiments and analysis	190
4.5.3. Measure of dynamicity	192
4.6. Conclusion.	196
4.7. Bibliography	196
Chapter 5. Optimization of Traffic at a Railway Junction: Scheduling Approaches Based on Timed Petri Nets	199
Thomas BOURDEAUD'HUY and Benoît TROUILLET	
5.1. Introduction	199
5.2. Scheduling in a railway junction	201
5.2.1. Classical scheduling	201
5.2.2. Flexible system scheduling	202
5.2.3. Dual Gantt diagram	203
5.2.4. The railway junction saturation problem	204
5.3. Petri nets for scheduling	206
5.3.1. Place/Transition Petri net	206
5.3.2. T-timed Petri nets	209

5.3.3. Controlled executions	211
5.3.4. Reachability problems in TPNs	212
5.3.5. Modeling of a railway junction with Petri nets	213
5.3.6. Approaches to solving the timed reachability problem	214
5.4. Incremental model for TPNs	216
5.4.1. Formulation operators “+” and “s”	220
5.4.2. Integer Mathematical Models	223
5.4.3. Numerical experiments	225
5.4.4. Study of the illustrative example of Figure 5.5	227
5.4.5. Conclusion and future work	228
5.5. A (max,+) approach to scheduling	229
5.5.1. Introduction and production hypotheses	230
5.5.2. Construction of a simple event graph associated with the initial model	233
5.5.3. Resolution of resource sharing	236
5.5.4. Application	242
5.5.5. Overview	246
5.6. Conclusion	247
5.7. Bibliography	248
List of Authors	253
Index	255
