**Introduction** . . . . . ix

**Chapter 1. The "Mixed Modeling" Approach to Reinforced Structures** . . . . . 1

1.1. Mechanics of reinforced systems in the "mixed modeling" framework . . . . . 2
1.1.1. Outline of the "mixed modeling" approach . . . . . 2
1.1.2. An illustrative example . . . . . 2
1.1.3. Mixed modeling in the context of material elastic behavior . . . . . 5
1.1.4. Extension to elastic–plastic behavior and yield design . . . . . 12
1.2. Application to the stability analysis of reinforced soil structures . . . . . 18
1.2.1. Stability analysis of a reinforced vertical excavation . . . . . 18
1.2.2. Stability analyses based on mechanisms involving deformation patterns . . . . . 24
1.2.3. Practical consequences for the stability analysis of reinforced structures . . . . . 28
1.3. Extensions and limitations of the mixed modeling approach . . . . . 32
1.3.1. A 2D/3D mixed modeling approach . . . . . 32
1.3.2. Incorporation of a matrix/reinforcement interface behavior . . . . . 35
1.3.3. A serious limitation to the 1D–3D mixed modeling approach . . . . 36

**Chapter 2. The Homogenization Approach: Reinforced Materials as Macroscopically Homogeneous Anisotropic Media** . . . . . 39

2.1. Fundamentals of the periodic homogenization method . . . . . 40
2.1.1. Outline of the homogenization method applied to the design of reinforced structures . . . . . 40

2.1.2. Macroscopic behavior of a periodically reinforced material: the auxiliary problem . . . . . 41
2.2. Macroscopic longitudinal elastic shear stiffness of a column-reinforced material . . . . . 47
2.2.1. Problem statement . . . . . 47
2.2.2. Upper bound estimate for $G_L$ . . . . . 48
2.2.3. Lower bound estimate for $G_L$ . . . . . 49
2.2.4. Comparison with numerical simulation and Hashin–Rosen's estimates. . . . . 50
2.2.5. Optimizing the reinforcement layout: the "cross-trench" configuration. . . . . 52
2.3. Elastoplastic analysis of column-reinforced soil foundations . . . . . 55
2.3.1. A closed-form macroscopic elastoplastic constitutive law . . . . . 55
2.3.2. A first analytical example . . . . . 60
2.3.3. Numerical implementation of the approximate elastoplastic model . . . . . 64
2.4. Yield design homogenization applied to reinforced soil structures . . . 72
2.4.1. Reinforced soil with purely cohesive constituents . . . . . 73
2.4.2. Reinforcement by "stone columns" . . . . . 80

**Chapter 3. Macroscopic Behavior of Materials Reinforced by Thin Highly Stiff/Resistant Linear Inclusions** . . . . . 93

3.1. Macroscopic linear elastic behavior . . . . . 94
3.1.1. A two-dimensional multilayer model . . . . . 94
3.1.2. Extension to the case of elastic fiber-reinforced composites . . . . 100
3.1.3. Synthesis of results: a simplified macroscopic stiffness tensor . . . 104
3.1.4. Numerical validation . . . . . 106
3.1.5. Two extended formulations of the macroscopic elastic behavior. . . . . 111
3.2. Macroscopic strength properties . . . . . 119
3.2.1. Plane strain multilayer model . . . . . 119
3.2.2. Generalization to multidirectional reinforced materials . . . . . 126
3.3. Macroscopic elastoplastic behavior . . . . . 137
3.3.1. Reinforced material as an anisotropic elastic perfectly plastic medium . . . . . 138
3.3.2. An improved strain hardening elastoplastic model . . . . . 141
3.4. Concluding remarks: toward a "multiphase" approach. . . . . 150

**Chapter 4. Mechanical Modeling of Reinforced Materials as Multiphase Systems** . . . . . 153

4.1. Construction of the multiphase model by the virtual work method. . . . 154
4.1.1. Unidirectional reinforced material as a two-phase system . . . . . 154
4.1.2. Links with the "mixed modeling" and homogenization approaches . . . . . 163
4.2. Linear elastic behavior . . . . . 167
4.2.1. Elastic constitutive equations and associated boundary value problem . . . . . 167
4.2.2. Revisiting the problem of shear-loaded reinforced layer . . . . . 171
4.2.3. Multiphase analysis of the reinforced block compression problem . . . . . 176
4.2.4. The multiphase approach as a generalized homogenization procedure . . . . . 181
4.3. Elastoplastic behavior of reinforced structures described as two-phase systems . . . . . 184
4.3.1. Elastoplastic constitutive equations and statement of the associated boundary value problem. . . . . 184
4.3.2. Numerical implementation of the model . . . . . 191
4.4. Yield strength of reinforced materials as multiphase media. . . . . 195
4.4.1. Statement of yield design problem relative to a two-phase system . . . . . 195
4.4.2. First examples of application . . . . . 200

**Chapter 5. Applications of the Multiphase Approach Part 1: Static and Dynamic Stiffness of Piled Raft Foundations** . . . . . 211

5.1. Evaluation of the static stiffness of piled raft foundations. . . . . 212
5.1.1. Statement of the problem . . . . . 212
5.1.2. Input data relative to the problem. . . . . 215
5.1.3. Numerical simulations and results . . . . . 216
5.2. Evaluating the dynamic horizontal and rocking impedance of pile groups. . . . . 220
5.2.1. Impedance matrix of a pile group foundation . . . . . 220
5.2.2. Elastodynamics of reinforced soil as a two-phase system . . . . . 221
5.2.3. Horizontal impedance of a piled strip foundation . . . . . 224
5.3. Vertical dynamic stiffness of square piled raft foundations . . . . . 229
5.3.1. Problem statement . . . . . 230
5.3.2. A multiphase model accounting for soil–pile interactions . . . . . 232
5.3.3. Identification of the multiphase model constitutive parameters . . . 235
5.3.4. Assessing the vertical impedance of the piled raft foundation . . . . 239

**Chapter 6. Applications of the Multiphase Approach Part 2: Load-Bearing Capacity and Stability Analysis of Reinforced Structures** . . . . . 243

6.1. Multiphase model accommodating for elastoplastic interaction behavior . . . . . 244
6.1.1. Statement of the elastoplastic boundary value problem . . . . . 244
6.1.2. A numerical procedure for evaluating the soil pile interaction parameters . . . . . 250
6.1.3. Identification of interaction parameters . . . . . 255
6.1.4. Application to the load-bearing analysis of piled raft foundations. . . . . 259
6.2. Stability analysis of reinforced structures using the multiphase yield design approach . . . . . 266
6.2.1. Stability of a reinforced earth retaining wall . . . . . 266
6.2.2. Seismic stability analysis of a piled embankment . . . . . 275

**Chapter 7. Yield Design of Reinforced Concrete Beams, Plates and Shells** . . . . . 289

7.1. Composite beams in membrane-bending interaction . . . . . 289
7.1.1. Formulation of the strength condition in terms of generalized stress variables: a homogenization procedure . . . . . 289
7.1.2. An illustration on the case of reinforced concrete . . . . . 292
7.1.3. On its use for yield design problems at the structure level . . . . . 295
7.2. Reinforced plates in bending . . . . . 295
7.2.1. Definition of the macroscopic bending strength criterion . . . . . 297
7.2.2. An illustration on the case of reinforced concrete . . . . . 300
7.2.3. On its use for yield design problems at the structure level . . . . . 302
7.3. A proposed simplified extension to the yield design of shells . . . . . 303
7.3.1. Generalized strength criteria of homogeneous shells . . . . . 303
7.3.2. Extension to heterogeneous shells. . . . . 308
7.3.3. Generalized yield lines . . . . . 312
