Foreword	ix
Preface	xi
Introduction	xiii
Chapter 1. Stress	1
1.1. Notion of stress	1
1.1.1. External forces	1
1.1.2. Internal cohesive forces	2
1.1.3. Normal stress, shear stress	2
1.2. Properties of the stress vector	3
1.2.1. Boundary conditions	3
1.2.2. Torsor of internal forces	5
1.2.3. Reciprocal actions	8
1.2.4. Cauchy reciprocal theorem	9
1.3. Stress matrix	11
1.3.1. Notation	11
1.3.2. Invariants of the stress tensor	13
1.3.3. Relation between the stress matrix and the stress vector	15
1.3.4. Principal stresses and principal directions	18
1.4. Equilibrium equation	21
1.5. Mohr's circle	23
Chapter 2. Strain	27
2.1. Notion of strain	27
2.1.1. Displacement vector	27

2.1.2. Unit strain	28
2.1.3. Angular distortion.	30
2.2. Strain matrix	33
2.2.1. Definition of the strain matrix	33
2.2.2. Principal strains and principal directions	37
2.2.3. Volume expansion	39
2.2.4. Invariants of strain tensor	40
2.2.5. Compatibility condition	40
2.3. Strain measurement: strain gage	41
Chapter 3. Behavior Law	43
3.1. A few definitions	43
3.2. Tension test.	43
3.2.1. Brittle materials	44
3.2.2. Ductile materials	45
3.2.3. Particular cases	46
3.3. Shear test	46
3.3.1. Brittle materials	47
3.3.2. Ductile materials	48
3.4. General rule	48
3.4.1. Linear elasticity	48
3.5. Anisotropic materials: example of a composite	53
3.5.1. Elasticity	53
3.6. Thermoelasticity	54
Chapter 4. Resolution Methods	59
4.1. Assessment	59
4.2. Displacement method	61
4.3. Stress method	61
4.4. Finite element method	62
Chapter 5. Work-energy Theorem: Principle of Finite Element Method	63
5.1. Work-energy theorem	63
5.1.1. Hypotheses	63
5.1.2. Strain energy	64
5.1.3. Work of external forces	65
5.1.4. Strain energy	66
5.1.5. Energy minimization: Ritz method	68

5.2. Finite element method	69
5.2.1. General principle of finite element method	69
5.2.2. Example of the three-node triangular element	74
5.3. Application: triangle with plate finite element using Catia.	80
Chapter 6. Sizing Criteria of an Aeronautical Structure	83
6.1. Introduction	83
6.2. Experimental determination of a sizing criterion	85
6.3. Normal stress or principal stress criterion: brittle material	87
6.4. Stress or maximum shear energy criterion: ductile material	91
6.4.1. Tresca criterion	91
6.4.2. Von Mises criterion	93
6.4.3. Rupture of a ductile material	96
6.5. Maximum shear criterion with friction: compression of brittle materials	99
6.6. Anisotropic criterion: example of the composite	105
Chapter 7. Plasticity	109
7.1. Introduction	109
7.2. Plastic instability: necking, true stress and true strain	111
7.3. Plastic behavior law: Ramberg–Osgood law	116
7.4. Example of an elastic–plastic calculation: plate with open hole in tension	118
Chapter 8. Physics of Aeronautical Structure Materials	127
8.1. Introduction	127
8.2. Aluminum 2024	130
8.3. Carbon/epoxy composite T300/914	135
8.4. Polymers	140
Chapter 9. Exercises	151
9.1. Rosette analysis	151
9.2. Pure shear	154
9.3. Compression of an elastic solid	154
9.4. Gravity dam	155
9.5. Shear modulus	156
9.6. Modulus of a composite	157
9.7. Torsional cylinder	158
9.8. Plastic compression	160
9.9. Bi-material beam tension	162

9.10. Beam thermal expansion	164
9.11. Cube under shear stress	165
9.12. Spherical reservoir under pressure	166
9.13. Plastic bending	169
9.14. Disc under radial tension	171
9.15. Bending beam: resolution by the Ritz method	173
9.16. Stress concentration in open hole	174
9.17. Bending beam	178
Chapter 10. Solutions to Exercises	183
10.1. Rosette analysis	183
10.2. Pure shear	191
10.3. Compression of an elastic solid	192
10.4. Gravity dam	196
10.5. Shear modulus	201
10.6. Modulus of a composite	203
10.7. Torsional cylinder	206
10.8. Plastic compression	212
10.9. Bi-material beam tension	215
10.10. Beam thermal expansion	225
10.11. Cube under shear stress	231
10.12. Spherical reservoir under pressure	235
10.13. Plastic bending	240
10.14. Disc under radial tension	245
10.15. Bending beam: resolution by the Ritz method	252
10.16. Stress concentration in open hole	256
10.17. Bending beam	259
Appendix	273
Bibliography	279
Index	281
