Preface	ix
List of Notations	xi
Introduction	xiii
Part 1. Inference in Parametric Statistical Experiments	1
Chapter 1. Statistical Experiments	3
1.1. Dominated and homogeneous statistical experiments	5
1.2. Experiments generated by a sample of independent and identically distributed random variables	7
1.3. Probability measures of exponential type	8
1.3.1. Properties of families of exponential type	9
1.3.2. Classic examples of families of exponential type	13
Chapter 2. Statistical Inference	19
2.1. Asymptotic properties of sequences of estimators	19
2.1.1. Consistency	20
2.2. Examples of sequences of estimators	24
2.2.1. Sequence of maximum likelihood estimators	24
2.2.2. Sequence of Bayesian estimators	38
2.3. Asymptotic normality	41

Chapter 3. Asymptotic Efficiency	55
3.1. Likelihood ratio, local asymptotic properties of the likelihoods and the van Trees inequality	60
3.1.1. Local asymptotic (mixing) normal property of the likelihoods	61
3.1.2. The van Trees inequality	62
3.2. LAN property for different statistical experiments	63
3.2.1. Statistical experiments generated by a sample of independent and identically distributed random variables	63
3.2.2. Statistical experiments generated by a sample of independent random variables	65
3.2.3. Statistical experiments generated by a homogeneous Markov chain	67
3.2.4. Fractional Gaussian noise statistical experiment	68
3.3. Asymptotic efficiency of some sequence of estimators	69
Part 2. Statistical Inference for Insurance	71
Chapter 4. Statistical Experiments in Insurance	73
4.1. Statistical inference in generalized linear models	73
4.2. Score and Fisher information of GLM statistical experiments	78
4.3. Asymptotic properties of the sequence of maximum likelihood estimators	81
4.4. Numerical approximations of the sequence of maximum likelihood estimators	83
4.4.1. Newton approximation	83
4.4.2. Fisher scoring and iterated weighted least square	86
Part 3. Statistical Inference for Finance	91
Chapter 5. Homogeneous Diffusion Processes	93
5.1. Examples of pricing in finance	93
5.1.1. Brownian motion and geometric Brownian motion	94
5.1.2. Interest rate curves	102

5.2. Examples of closed-form transition probability density functions	106
5.2.1. Ornstein–Uhlenbeck process	106
5.2.2. Geometric Brownian motion	107
5.2.3. Cox–Ingersoll–Ross	108
5.2.4. Constant elasticity of variance model	110
5.3. Simulation of diffusions	112
5.3.1. Exact simulations of specific models	112
5.3.2. Euler–Maruyama scheme	113
5.3.3. Milstein scheme	114
5.4. General classes of diffusion processes	115
5.4.1. Chan–Karolyi–Longstaff–Sanders	115
5.4.2. Ergodic diffusions with specified stationary distribution	116
Chapter 6. Statistical Experiments in Finance	119
6.1. Large-sample convergence scheme	121
6.1.1. Exact likelihood inference	123
6.1.2. Fokker–Planck–Kolmogorov PDE approximation	130
6.1.3. Monte Carlo simulations	132
6.1.4. Notes	135
6.2. Mixed convergence scheme	135
6.2.1. Exact likelihood inference	137
6.2.2. Maximum quasi-likelihood estimator	138
6.2.3. Comments	145
6.3. High-frequency convergence scheme	146
6.3.1. Exact likelihood inference	148
6.3.2. Maximum quasi-likelihood estimator	152
6.3.3. Maximum of contrast estimators	155
6.3.4. Notes	156
Appendices	157
Appendix 1. Cholesky Method	159

Appendix 2. $L^2(\nu)$-Differentiable Family of Probability Measures	163
Appendix 3. Stochastic Calculus	177
Bibliography	179
Index	185
