Preface	ix
List of Notations	xiii
Chapter 1. One-dimensional Viscoelastic Modeling	1
1.1. Experimental observations	1
1.2. Fundamental uniaxial tests	2
1.2.1. Creep test, creep function	2
1.2.2. Stress relaxation test, relaxation function	5
1.2.3. First comments	7
1.2.4. Recovery	8
1.2.5. Stress fading	9
1.3. Functional description	10
1.4. Aging	11
1.4.1. Aging phenomenon	11
1.4.2. Non-aging materials	12
1.5. Linear behavior	14
1.5.1. Superposition principle: Boltzmannian materials	14
1.5.2. Linear elasticity	15
1.6. Linear viscoelastic material	15
1.6.1. Instantaneous behavior	16
1.6.2. Creep and relaxation functions	16
1.6.3. Recovery and stress fading	18
1.6.4. Instantaneous behavior	19
1.6.5. Validation of the linearity hypothesis: an example	19
1.7. Linear viscoelastic constitutive equation	20
1.7.1. Arbitrary stress history	20

1.7.2. Arbitrary deformation history	23
1.7.3. Linear elastic material	24
1.7.4. Boltzmann's formulas, integral operator	24
1.7.5. Comments	26
1.8. Non-aging linear viscoelastic constitutive equation	27
1.8.1. Creep and relaxation functions	27
1.8.2. Boltzmann's formulas	28
1.8.3. Recovery and stress fading	30
1.8.4. Operational calculus	30
1.9. One-dimensional linear viscoelastic behavior.	33
1.9.1. Uniaxial viewpoint and one-dimensional modeling.	33
1.9.2. Structural elements	36
1.10. Harmonic loading process	39
1.10.1. The loading process.	39
1.10.2. Asymptotic harmonic regime	40
1.10.3. Complex modulus.	41
1.10.4. Loss angle, specific loss	43
Chapter 2. Rheological Models	45
2.1. Rheological models	45
2.2. Basic elements	45
2.2.1. Linear elastic element	45
2.2.2. Linear viscous element.	46
2.3. Classical models	47
2.3.1. Maxwell model	47
2.3.2. Kelvin model	49
2.3.3. The standard linear solid.	51
2.4. Generalized Maxwell and Kelvin models	56
2.4.1. Generalized Maxwell model	57
2.4.2. Generalized Kelvin model.	58
2.4.3. Equivalence	59
2.4.4. Continuous spectra	60
Chapter 3. Typical Case Studies	63
3.1. Presentation and general features	63
3.2. "Creep-type" problems	64
3.2.1. Homogeneous cantilever beam subjected to a uniformly distributed load	64
3.2.2. Homogeneous cantilever beam subjected to a concentrated load	68

3.2.3. Homogeneous statically indeterminate beam	70
3.2.4. A statically indeterminate system	72
3.3. Prestressing of viscoelastic systems or structures	75
3.3.1. Prestressed cantilever beam	75
3.3.2. Prestressed hyperstatic system	79
3.3.3. Prestressed hyperstatic arc	80
3.3.4. The example of a rheological model	84
3.3.5. Practical applications	88
3.4. A complex loading process	93
3.4.1. A practical problem	93
3.4.2. Mathematical treatment	95
3.4.3. Comments	97
3.5. Heterogeneous viscoelastic structures	98
Chapter 4. Three-dimensional Linear Viscoelastic Modeling	103
4.1. Multidimensional approach	103
4.2. Fundamental experiments	104
4.2.1. The three-dimensional continuum framework	104
4.2.2. General definition of the creep and relaxation tests	105
4.2.3. The linearity hypothesis	105
4.2.4. Tensorial creep and relaxation functions	106
4.2.5. Instantaneous elasticity	107
4.3. Boltzmann's formulas	108
4.3.1. Integral operator	108
4.3.2. Important identities	109
4.4. Isotropic linear viscoelastic material	110
4.4.1. Material symmetries, principle of material symmetries	110
4.4.2. Isotropic linear viscoelastic material: creep test	111
4.4.3. Isotropic linear viscoelastic material: relaxation test	113
4.4.4. Boltzmann's formulas	114
4.4.5. Uniaxial tension relaxation test	115
4.4.6. Constant Poisson's ratio	118
4.5. Non-aging linear viscoelastic material	120
4.5.1. Boltzmann's formulas	120
4.5.2. Operational calculus	121
4.5.3. Isotropic material	122
Chapter 5. Quasi-static Linear Viscoelastic Processes	125
5.1. Quasi-static linear viscoelastic processes	125

5.1.1. Isothermal quasi-static processes	125
5.1.2. Isothermal quasi-static linear viscoelastic processes	128
5.1.3. Superposition principle	129
5.1.4. Loading parameters, kinematic parameters	129
5.2. Solution to the linear viscoelastic quasi-static evolution problem	131
5.2.1. Statically admissible stress histories, kinematically admissible displacement histories	131
5.2.2. Solution methods	132
5.3. Homogeneous isotropic material with constant Poisson's ratio	133
5.3.1. Creep-type problems, creep-type evolutions	134
5.3.2. Relaxation-type problems, relaxation-type evolutions	135
5.3.3. Mixed data problems	137
5.3.4. Comments	139
5.4. Non-aging linear viscoelastic material	140
5.4.1. Correspondence principle	140
5.4.2. Comments	142
Chapter 6. Some Practical Problems	143
6.1. Presentation	143
6.2. Uniaxial tension–compression of a cylindrical rod	143
6.2.1. Statement of the problem	143
6.2.2. Solution	145
6.3. Bending of a cylindrical rod	148
6.3.1. Statement of the problem	148
6.3.2. Solution	149
6.4. Twisting of a cylindrical rod	152
6.4.1. Preliminary comments	152
6.4.2. Statement of the problem	153
6.4.3. Solution	154
6.4.4. Comment	157
6.5. Convergence of a spherical cavity	158
6.5.1. Statement of the problem	158
6.5.2. Solution	160
Appendix	163
References	167
Index	175
