Foreword	ix
Preface	xiii
Acknowledgments	xv
Introduction	xvii
Chapter 1. Overview of the Scientific Basis for the Greenhouse Effect and Geocycles	1
1.1. Greenhouse effect	1
1.2. The additional criteria of the emissions in the atmosphere.	3
1.2.1. The carbon geocycle	3
1.2.2. The water geocycle	9
1.3. Answers to exercises in Chapter 1	11
Chapter 2. General Methodology for Quantification of a Climate Footprint	15
2.1. Description of the problem	15
2.2. Identification of the greenhouse gases to be included	15
2.3. Quantification of the impact of greenhouse gases on the climate: radiative forcing.	17
2.4. Quantification of the relative climate impact: the Global Warming Potential	18
2.5. Climate impact of gases in relation to their quantity: the emission factor of greenhouse gases	23
2.6. Impact of greenhouse gas emission processes on the climate: the emissions factor of any material.	23

2.7. Impact of an activity on the climate: generalization of the characterization of flows	25
2.8. Answers to the exercises in Chapter 2	27
Chapter 3. Quantification of the Climate Footprint of an Organization: Methodology of the Balance of Emissions	33
3.1. The various methods.	33
3.2. The broad-spectrum greenhouse gas emission balance.	34
3.3. The system at hand: processes and flows	38
3.4. Data harvesting	39
3.5. The case of the regulatory greenhouse gas emission balance in France	40
3.6. Answers to the exercises in Chapter 3	43
Chapter 4. Calculation of Emissions	47
4.1. Emissions due to the use of energy.	47
4.2. Other direct emissions (excluding energy)	49
4.3. Emissions due to manufacturing of inputs.	49
4.4. Emissions due to transport of merchandise	50
4.4.1. Road transport.	50
4.4.2. Non-road transport	61
4.5. Emissions due to movements of people	61
4.6. Emissions due to waste treatment	62
4.7. Emissions due to the production of tangible assets	66
4.8. Emissions due to the use of products.	68
4.9. Emissions due to the end of life of products.	72
4.10. Calculation of uncertainties	73
4.10.1. Emissions due to the incineration of plastic waste (see section 6.1.3.7.3)	76
4.10.2. Emissions due to transportation of sawdust supplies (see section 6.1.3.5.2)	77
4.11. Answers to the exercises in Chapter 4	79
Chapter 5. Results Analysis	81
5.1. Recommended actions.	81
5.2. Interpreting balances	81
5.3. Carbon dashboard	83
5.4. Answer to the exercise in Chapter 5	84

Chapter 6. Case Studies	85
6.1. Case study 1: brickworks	86
6.1.1. Description of the activity and challenge in the exercise	86
6.1.2. Activity data and emissions factors	87
6.1.3. Calculation of emissions	97
6.1.4. Recap of the quantification of emissions	117
6.1.5. Recommendations	118
6.2. Case study 2: vineyard	126
6.2.1. Description of the activity	126
6.2.2. Challenge in this exercise	126
6.2.3. Specifications about the activity and questions.	127
6.2.4. Activity data.	127
6.2.5. Answer to case study 2: winemaking industry	132
6.3. Case study 3: factory for production of animal feed	137
6.3.1. Description of the activity	137
6.3.2. Challenge in this exercise	139
6.3.3. Specific activity data	139
6.3.4. Answer to case study 3: factory for production of animal feed	140
Conclusion	163
Appendices	165
Appendix 1. For a Physical Economy	167
Appendix 2. Explanation of the Calculation Methods for Emissions due to Transport of Merchandise	183
Appendix 3. Accounting of Emissions due to the Production of Fixed Assets	191
Appendix 4. Emissions Related to Journeys Made Between the Brickworks and Employees' Places of Residence: Analysis of Sensitivity to Calculation Hypotheses (Case Study 1)	203
References	209
Index	217
