Foreword	ix
Jonathan TENNYSON	
Introduction	xiii
Iwona GULACZYK, Michaël REY and Ha TRAN	
Chapter 1. Automated Rovibrational Configuration Interaction Calculations	1
Subhasish DAS and Guntram RAUHUT	
1.1. Introduction.	1
1.2. The Hamiltonian	2
1.3. VSCF/VCI calculations.	5
1.4. RVCi calculations	10
1.5. Infrared intensities.	19
1.6. Conclusion and outlook.	24
1.7. Acknowledgments.	26
1.8. References	26

Chapter 2. Efficient Numerical and Group-Theoretical Methods for Computing Spectra	31
Michaël REY	
2.1. Introduction.	31
2.2. Exploiting symmetry in molecular spectroscopy	32
2.2.1. Group theory for rigid and nonrigid molecules	33
2.2.2. Symmetry-adapted functions and irreducible tensor operators	35
2.3. Variational calculation	42
2.3.1. Computation of ro-vibrational energy levels by pruning the basis	42
2.3.2. Nested tensor train contracted basis functions and symmetry	45
2.4. Hamiltonian for semirigid molecules.	49
2.4.1. ITO formulation of the Eckart–Watson Hamiltonian	49
2.4.2. ITO formulation of Eckart-frame Hamiltonians in curvilinear coordinates.	51
2.4.3. ITO formulation of ab initio effective Hamiltonians and dipole moment operators	53
2.5. Hybrid Hamiltonian for non-rigid molecules: ITO formulation of the Hougen–Bunker–Johns formalism	55
2.6. Calculation of rotation–vibration spectra	58
2.7. References	59
 Chapter 3. Isolated Line Shape Theory	65
Ha TRAN, Ngoc Hoa NGO and Piotr WCISŁO	
3.1. Introduction.	65
3.2. Doppler broadening and the Gauss profile	67
3.3. Collisional broadening and shift and the Lorentz and Voigt profiles	68
3.3.1. Collisional broadening and shift and the Lorentz profile.	68
3.3.2. The usual Voigt profile.	68
3.4. Refined collisional effects and line-shape profiles	71
3.4.1. Dicke narrowing effect.	71
3.4.2. The speed dependence of line broadening and shift.	75
3.4.3. The Hartmann–Tran profile	78
3.4.4. The modified Hartmann–Tran profile	82
3.5. Beyond the impact approximation	86
3.6. Conclusion	87
3.7. References	87

Chapter 4. Semi-Classical Line-shape Theory 95

Robert R. GAMACHE

4.1. Introduction.	95
4.2. Semi-classical line-shape theory	97
4.2.1. From ATC theory to modern semi-classical theories	97
4.2.2. Collisional line broadening and shifting.	98
4.2.3. Components contributing to the broadening and shifting.	104
4.2.4. The physics of what is going on	106
4.2.5. What does an understanding of the collisional line broadening mechanism tell us?	109
4.3. The semi-classical CRBM theory.	112
4.4. Components of the calculation to be considered	113
4.4.1. Trajectory models.	114
4.4.2. Velocity integration versus mean-relative thermal velocity approximation	116
4.4.3. Effect of imaginary components on the pressure-broadened half-width	116
4.4.4. The atom–atom component of the intermolecular potential and the effects of its expansion.	118
4.4.5. Adjusting the atom–atom potential.	121
4.4.6. Line coupling	124
4.5. Temperature dependence of γ and δ	125
4.6. Comparison with measurement	130
4.7. Speed dependence of γ and δ	132
4.8. Vibrational effects.	135
4.9. Predicting line-shape parameters	135
4.10. Conclusion	139
4.11. References.	140

Chapter 5. Ab Initio Calculations of Line-Shape Parameters 153

Hubert JÓŹWIAK and Piotr WCISŁO

5.1. Formulation of the line-shape problem.	153
5.1.1. Derivation of the generalized Waldmann–Snider equation	159
5.1.2. State multipoles	168
5.1.3. Spectral line shape within the Hess method	171
5.1.4. Relation to the phenomenological line-shape models.	177
5.1.5. Generalizations and other approaches to the spectral line shape problem.	180

5.2. Quantum scattering theory	181
5.3. Application of the fully ab initio approach to molecular systems	188
5.4. References	192

**Chapter 6. Line Mixing Within and Beyond the
Impact Approximation 199**

Christian BOULET and Ha TRAN

6.1. Introduction.	199
6.2. Collisional line mixing within the impact approximation.	202
6.2.1. Some basic equations.	202
6.2.2. The weak overlapping regime.	204
6.2.3. Profile in the near wing of a cluster of lines	206
6.2.4. Profile in the near wing of a vibrational band	207
6.2.5. Building the impact relaxation matrix	209
6.3. Line mixing beyond the impact approximation.	226
6.3.1. Introduction	226
6.3.2. Empirical models: the correcting χ factor.	227
6.3.3. Far wings: the quasi-static approach of Rosenkranz	227
6.3.4. From resonance to the far wings: non-Markovian ECS model . .	231
6.3.5. Direct predictions from rCMDS (and CMDS)	234
6.4. Conclusion	235
6.5. References	235

Conclusion 243

Iwona GULACZYK, Michaël REY and Ha TRAN
