Introduction	xi
Chapter 1. What Is Plasma?	1
1.1. Under what conditions is matter in the plasma state?	1
1.1.1. Electric discharges	2
1.1.2. Heating	3
1.1.3. Radiation absorption	5
1.1.4. Different types of plasmas	5
1.2. Plasma diagnostics: remote or <i>in situ</i>	8
1.3. Effects that dominate physics.	11
1.3.1. Screening phenomenon.	11
1.3.2. Binary interactions or collective forces?	13
1.3.3. Role of quantum effects	15
1.3.4. Role of the magnetic field	16
1.4. Coupled field/particle system: general case	16
1.5. Special case: plasma oscillation	17
1.5.1. Position of the problem.	17
1.5.2. Field created by electric charges.	18
1.5.3. Displacement of charged particles due to the field.	19
1.5.4. Coupled system resolution	20
1.6. Plasma frequency	22
1.6.1. $\tau = \omega_{pe}^{-1}$: characteristic electron response time	22
1.6.2. Some characteristic plasma frequencies.	22
1.7. Effects of temperature.	23
1.7.1. The velocity distribution function	24
1.7.2. The different theoretical treatments	26

1.8. Some examples of application of plasma physics	26
1.8.1. Nuclear fusion and plasma physics	26
1.8.2. Cold plasmas and their applications	29
1.8.3. Production of energy particles by plasma accelerator	31
1.8.4. Astrophysical plasmas	31
Chapter 2. Individual Trajectories in an Electromagnetic Field	33
2.1. Trajectory of a particle in a uniform and stationary magnetic field	33
2.1.1. Without electric field ($E = 0$)	33
2.1.2. With a stationary and uniform electric field ($E \neq 0$)	35
2.1.3. Constant force	37
2.2. Slowly variable fields	38
2.2.1. Drift in a non-uniform B-field, with $E = 0$	39
2.2.2. Drift in a variable E-field	42
2.2.3. First adiabatic invariant	45
2.3. Small disturbances of a periodic motion	49
2.3.1. General results (for a Hamiltonian system)	49
2.3.2. An example with three adiabatic invariants	50
2.4. Appendices	51
2.4.1. Magnetic field velocity	51
2.4.2. Mirror force	52
2.4.3. Movement of particles in the magnetosphere	53
Chapter 3. Kinetic Theory of Plasma	57
3.1. Plasma distribution function	57
3.1.1. Definition	57
3.1.2. Experimental measurement of the distribution function	60
3.1.3. Special case: the Maxwellian distribution	62
3.2. Kinetic equation	64
3.2.1. General form	64
3.2.2. Vlasov equation	67
3.3. Different collision operators	69
3.3.1. Boltzmann equation	69
3.3.2. Landau (1936) and BGL Operators (Lenard 1960, Balescu 1960, Guernsey 1962)	71
3.3.3. BGK operator (Bhatnagar, Gross and Krook, 1954)	73
3.3.4. Fluid consequences of collision operators	74

Chapter 4. Plasma Fluid Modeling and MHD Limit	75
4.1. Definition of fluid quantities	75
4.1.1. Moments of the distribution function	75
4.1.2. Definitions of pressure and equation of state	76
4.1.3. Kinetic energy	78
4.2. Evolution equations of fluid quantities	79
4.2.1. Equation of density transport (conservation of the number of particles)	79
4.2.2. Equation of momentum transport	80
4.2.3. Transport of energy	81
4.3. Closure equations	82
4.3.1. Domain of validity of fluid equations	82
4.3.2. Isotropic pressure	83
4.3.3. Anisotropic pressure in the presence of a magnetic field	84
4.3.4. General case	86
4.4. Multi-fluid description of plasma	86
4.4.1. Concept of “population” and multi-fluid system	86
4.4.2. Slow variation hypothesis	88
4.4.3. Statement of slow variation hypotheses	89
4.4.4. Consequences	89
4.5. MHD (magneto-hydrodynamic) description	91
4.5.1. Reduction of the number of populations for the same species	91
4.5.2. Case of $N = 2$: bi-fluid system and MHD	92
4.5.3. The Laplace force in MHD: magnetic pressure and stress	95
4.5.4. Ohm’s law and the effect of non-ideality	97
4.5.5. Conservation of energy	98
4.5.6. MHD equilibrium conditions	98
4.5.7. Examples of MHD balance	99
4.6. Appendices	102
4.6.1. Transport equations in conservative form	102
4.6.2. Frozen field and reconnection	103
 Chapter 5. Waves in Plasmas in the Fluid Approximation	 107
5.1. Waves in plasmas: modes of propagation	107
5.2. Calculation of the propagation eigenmodes: classical method	109
5.2.1. Writing the system of differential equations	110
5.2.2. Linearization	110
5.2.3. Research of complex exponential solutions (“algebraization”)	110
5.2.4. Resolution	111

5.3. Fluid treatment of the plasma wave	112
5.4. Example of “electron” instability: two-stream instability	116
5.5. Other “electron” propagation modes	119
5.5.1. System of equations	120
5.5.2. Electromagnetic waves in non-magnetized cold plasma: cutoff frequency.	120
5.5.3. “Electronic” waves in a magnetized plasma	127
5.5.4. Role of the static magnetic field	128
5.6. Two-fluid system: low-frequency propagation modes	130
5.6.1. Ion-acoustic waves	130
5.6.2. Alfvén Waves	132
5.7. MHD propagation modes	136
5.7.1. Writing and resolution of the linearized system	136
5.7.2. Some remarks	140
5.8. Excitation of waves in plasma	141
5.9. Annexes	146
5.9.1. CMA Diagram	146
Chapter 6. Kinetic Effects: Landau Damping	149
6.1. Kinetic treatment of waves in plasmas.	149
6.1.1. Fluid modes and kinetic modes	149
6.1.2. Eigenmodes: expected number and possibilities of excitation	150
6.1.3. Kinetic damping: a mechanical analogy	151
6.2. Example of Langmuir mode	153
6.2.1. Resonant particles.	154
6.2.2. Simulation of the Langmuir mode.	155
6.3. Kinetic calculation of the Langmuir mode: eigenmodes of the Vlasov/Gauss system	157
6.3.1. System of equations	157
6.3.2. Algebraized system.	158
6.3.3. Resolution	159
6.3.4. Concept of kinetic eigenmodes	163
6.4. Role of resonant particles	169
6.4.1. Definitions.	169
6.4.2. Nonlinear dynamics of electrons in the wave field.	170
6.4.3. Estimation of energy exchanges between field and particles	172
6.4.4. Number of resonant particles tending towards zero: fluid limit.	176
6.4.5. Reverse Landau effect	177

6.5. Other methods of calculating eigenmodes	180
6.6. Other damped kinetic modes and other resonances	180
6.6.1. Landau effect for modes other than the Langmuir mode	180
6.6.2. Cyclotron resonances	182
6.6.3. Other resonances	182
6.7. Damping and reversibility	183
6.8. Appendices	184
6.8.1. Landau-Laplace method of finding eigenmodes	184
6.8.2. Laplace transformation for the calculation of kinetic modes	190
Chapter 7. Shockwaves and Discontinuities	195
7.1. Some examples of shocks and discontinuities	195
7.2. Existence of discontinuities	200
7.2.1. Absence of stationary gradient	200
7.2.2. Nonlinear steepening	202
7.2.3. Formation of discontinuities	203
7.3. Establishment of jump equations	204
7.3.1. Definition of jump equations	204
7.3.2. Application to the MHD equations	206
7.3.3. de Hoffmann–Teller frame	207
7.4. Different types of discontinuities that can exist in plasma	208
7.4.1. System solutions	208
7.4.2. Properties of rotational discontinuities	210
7.4.3. Shocks	211
7.4.4. Tangential discontinuity	214
7.5. Magnetospheric boundaries	215
