<b>Introduction</b> . . . . .	ix
<b>Chapter 1. Basic Notions</b> . . . . .	1
1.1. Introduction . . . . .	1
1.2. Logical notions . . . . .	2
1.2.1. Axioms . . . . .	3
1.2.2. Elementary laws . . . . .	5
1.3. Probabilistic notions . . . . .	5
1.3.1. Probability $D(t)$ and probability density $\rho(t)$ . . . . .	5
1.3.2. Failure occurrence rate $\lambda(t)$ . . . . .	6
1.3.3. Independent random events . . . . .	7
1.4. System functional description . . . . .	8
1.5. Binary system and basic model . . . . .	10
1.6. The availability of binary systems . . . . .	11
1.7. The sojourn probabilities . . . . .	15
1.7.1. Reliability model . . . . .	15
1.7.2. Maintainability . . . . .	17
1.8. Failure, repair and stochastic processes . . . . .	19
1.8.1. Renewable stochastic processes . . . . .	20
1.8.2. Conditionally renewable stochastic processes . . . . .	22
1.9. Multistate system . . . . .	24
<b>Chapter 2. Modeling of Multistate Systems</b> . . . . .	27
2.1. Systems with analytical representation . . . . .	28
2.2. Critical transitions . . . . .	32
2.3. Binarization of multistate systems . . . . .	32

2.4. Failure-to-start probability . . . . .	37
2.5. Forbidden transitions . . . . .	37
2.6. Boolean models and state graphs equivalence . . . . .	39
2.7. Systems with systemic structure representation . . . . .	41
2.8. The Markov graph. . . . .	43
 <b>Chapter 3. Matrix-like System</b> . . . . .	47
3.1. Introduction. . . . .	47
3.2. Modeling the functional state of the system. . . . .	48
3.2.1. Modeling a line of elementary components . . . . .	49
3.2.2. System functional space modeling. . . . .	49
3.2.3. The subspaces of sets . . . . .	56
3.2.4. Transitions between sets. . . . .	57
3.2.5. Modeling of equivalent rates of transitions. . . . .	58
3.2.6. Dynamic modeling of operating states . . . . .	61
3.3. Homogeneous matrix-like system . . . . .	62
3.4. Academic case . . . . .	64
3.4.1. Case specifications . . . . .	64
3.4.2. Determine system performance. . . . .	65
3.4.3. Results . . . . .	65
3.5. Conclusion . . . . .	65
 <b>Chapter 4. Modeling of Systems with Redundancy</b> . . . . .	69
4.1. Introduction. . . . .	69
4.2. Combinatorial analysis of the $n/N$ system . . . . .	70
4.3. Determining the availability/unavailability . . . . .	71
4.3.1. Analysis by the binary structure function. . . . .	71
4.3.2. Analysis by Boolean expressions . . . . .	72
4.3.3. Example of analysis using Boolean expressions. . . . .	75
4.4. The equivalent failure and repair rates . . . . .	77
4.5. Homogeneous system. . . . .	79
4.5.1. Characterization of the homogeneous system . . . . .	79
4.6. Numerical application (1) . . . . .	80
4.7. Numerical application (2) . . . . .	82
4.7.1. Mission success criteria and system data . . . . .	82
4.7.2. Functional modeling by state graph . . . . .	82
4.7.3. System availability modeling. . . . .	83
4.7.4. Modeling system unavailability . . . . .	85

4.7.5. Modeling the equivalent failure rate of the system . . . . .	86
4.7.6. The mean time before detection . . . . .	87
4.7.7. Redundancy effectiveness assessment. . . . .	88
 <b>Chapter 5. System Reliability – Application . . . . .</b>	 91
5.1. Description of the system . . . . .	92
5.2. System missions . . . . .	93
5.3. Basic data . . . . .	93
5.4. System unavailability modeling. . . . .	94
5.5. System unavailability assessment. . . . .	96
5.6. System availability modeling . . . . .	98
5.7. System availability assessment . . . . .	99
5.8. Reliability modeling. . . . .	100
5.9. System reliability assessment . . . . .	104
5.10. Analysis of the relative importance of components . . . . .	105
5.10.1. The predictive importance index . . . . .	105
5.10.2. The operational importance index . . . . .	107
5.11. Conclusion . . . . .	111
 <b>Chapter 6. Sequential Events – Modeling and Analysis . . . . .</b>	 113
6.1. Introduction. . . . .	113
6.2. Sequential analysis with variable time intervals . . . . .	116
6.3. Sequential analysis with fixed time intervals . . . . .	122
6.4. Conclusion . . . . .	124
 <b>Chapter 7. The Monte Carlo Simulation Method . . . . .</b>	 125
7.1. Generation of random variables. . . . .	125
7.2. Sampling . . . . .	127
7.3. Analytical bijective sampling . . . . .	127
7.4. Generic Monte Carlo simulation approach . . . . .	130
7.5. Simulation of transitions in a multistate system . . . . .	132
7.5.1. The transition simulation approach . . . . .	134
7.5.2. Transitions simulation algorithm. . . . .	135
7.5.3. Transition histogram simulation results . . . . .	136
7.5.4. The number of sojourns by state . . . . .	139
7.5.5. Sojourn time by state. . . . .	140
7.5.6. The failure probability . . . . .	141

7.6. Simulation of the operation of a redundant system . . . . .	143
7.6.1. System description . . . . .	144
7.6.2. Operation histogram generation algorithm . . . . .	144
7.6.3. Operation histogram . . . . .	146
7.6.4. The mean time to fail . . . . .	147
7.6.5. Algorithm for determining system reliability . . . . .	149
7.6.6. System reliability estimation . . . . .	150
7.7. Conclusion . . . . .	151
 <b>Chapter 8. Physical Tests used in Reliability</b> . . . . .	153
8.1. Introduction . . . . .	153
8.2. Accelerated tests . . . . .	155
8.2.1. The different acceleration laws . . . . .	156
8.3. Simple mechanical fatigue, Wöhler model . . . . .	159
8.3.1. Empirical laws of fatigue . . . . .	161
8.4. Aggravated tests . . . . .	162
8.4.1. The main aggravated tests . . . . .	163
8.5. Bayesian tests . . . . .	172
8.6. Fatigue damage analysis . . . . .	173
8.6.1. Formulations and development . . . . .	173
8.6.2. Fatigue damage . . . . .	176
8.7. Methodology of improvement using physical tests . . . . .	178
8.7.1. Optimization of the physical tests to be carried out . . . . .	178
8.8. Conclusion . . . . .	182
 <b>Appendix: Common Reliability Modeling Laws</b> . . . . .	185
 <b>References</b> . . . . .	191
 <b>Index</b> . . . . .	195
