Contents

Preface xi

Introduction xiii

Chapter 1. Methods for Determining Convection Heat Transfer Coefficients 1

1.1. Introduction. 1
1.2. Characterizing the motion of a fluid 1
1.3. Transfer coefficients and flow regimes 3
1.4. Using dimensional analysis 4
1.4.1. Dimensionless numbers used in convection 4
1.4.2. Dimensional analysis applications in convection 7
1.5. Using correlations to calculate *h* 12
1.5.1. Correlations for flows in forced convection 14
1.5.2. Correlations for flows in natural convection 14

Chapter 2. Forced Convection inside Cylindrical Pipes 15

2.1. Introduction. 15
2.2. Correlations in laminar flow 15
2.2.1. Reminders regarding laminar-flow characteristics inside a pipe . . 16
2.2.2. Differential energy balance 17
2.2.3. Illustration: transportation of phosphate slurry in a cylindrical pipe 22
2.2.4. Correlations for laminar flow at pipe entrance. 25
2.3. Correlations in transition zone. 30
2.4. Correlations in turbulent flow 30

2.4.1. Dittus–Boelter–McAdams relation. 31
2.4.2. Colburn–Seider–Tate relation 32
2.4.3. Illustration: improving transfer by switching to turbulent flow . . . 33
2.4.4. Specific correlations in turbulent flow 34
2.4.5. Illustration: industrial-grade cylindrical pipe. 38
2.5. Dimensional correlations for air and water 39

Chapter 3. Forced Convection inside Non-cylindrical Pipes 43

3.1. Introduction. 43
3.2. Concept of hydraulic diameter. 43
3.3. Hydraulic Nusselt and Reynolds numbers. 45
3.4. Correlations in established laminar flow. 45
3.4.1. Pipes with rectangular or square cross-sections in laminar flow . . 45
3.4.2. Pipes presenting an elliptical cross-section in laminar flow 46
3.4.3. Pipes presenting a triangular cross-section in laminar flow 47
3.4.4. Illustration: air-conditioning duct design 48
3.4.5. Annular pipes with laminar flow. 51
3.5. Correlations in turbulent flow for non-cylindrical pipes 57
3.5.1. Pipes with rectangular or square cross-sections in turbulent flow . 57
3.5.2. Pipes with elliptical or triangular cross-sections in turbulent flow . 58
3.5.3. Illustration: design imposes the flow regime. 60
3.5.4. Annular pipes in turbulent flow 62

Chapter 4. Forced Convection outside Pipes or around Objects . . 69

4.1. Introduction. 69
4.2. Flow outside a cylindrical pipe 70
4.3. Correlations for the stagnation region 71
4.4. Correlations beyond the stagnation zone. 72
4.5. Forced convection outside non-cylindrical pipes. 72
4.5.1. Pipes with a square cross-section area. 72
4.5.2. Pipes presenting an elliptical cross-section area 74
4.5.3. Pipes presenting a hexagonal cross-section area. 74
4.6. Forced convection above a horizontal plate 76
4.6.1. Plate at constant temperature 76
4.6.2. Plate with constant flow density 77
4.7. Forced convection around non-cylindrical objects. 79
4.7.1. Forced convection around a plane parallel to the flow 79
4.7.2. Forced convection around a sphere 80
4.8. Convective transfers between falling films and pipes 80
4.8.1. Vertical tubes 81
4.8.2. Horizontal tubes. 82

4.9. Forced convection in coiled pipes. 83
4.9.1. Convection heat transfer coefficient inside the coil 84
4.9.2. Convection heat transfer coefficient with the outer wall of the coil 85
4.9.3. Convection heat transfer coefficient between the fluid and the tank. 87

Chapter 5. Natural Convection Heat Transfer 89

5.1. Introduction. 89
5.2. Characterizing the motion of natural convection 89
5.3. Correlations in natural convection 91
5.4. Vertical plates subject to natural convection 92
5.5. Inclined plates subject to natural convection 94
5.6. Horizontal plates subject to natural convection. 95
5.6.1. Case of underfloor heating 95
5.6.2. Ceiling cooling systems 96
5.7. Vertical cylinders subject to natural convection 97
5.8. Horizontal cylinders subject to natural convection. 98
5.9. Spheres subject to natural convection 99
5.10. Vertical conical surfaces subject to natural convection 100
5.11. Any surface subject to natural convection 101
5.12. Chambers limited by parallel surfaces 101
5.12.1. Correlation of Hollands *et al*. for horizontal chambers 103
5.12.2. Correlation of El-Sherbiny *et al*. for vertical chambers. 104
5.13. Inclined-plane chambers 105
5.13.1. For large aspect ratios and low-to-moderate inclinations. 105
5.13.2. For lower aspect ratios and inclinations below the critical inclination 106
5.13.3. For lower aspect ratios and inclinations greater than the critical inclination 106
5.14. Chambers limited by two concentric cylinders 107
5.15. Chambers limited by two concentric spheres 109
5.16. Simplified correlations for natural convection in air 111
5.16.1. Vertical cylinder or plane under natural convection in air 111
5.16.2. Horizontal cylinder or plane under natural convection in air. . . . 111
5.16.3. Horizontal plane under natural convection in air. 112
5.16.4. Sphere under natural convection in air. 112
5.16.5. Circuit boards under natural convection in air 112
5.16.6. Electronic components or cables under natural convection in air . 113

5.17. Finned surfaces: heat sinks in electronic systems 113
5.17.1. Dissipation systems 114
5.17.2. Thermal resistance of a heat sink 115
5.18. Optimizing the thermal resistance of a heat sink 117
5.18.1. Determining the heat-sink/air heat transfer coefficient 119
5.18.2. Calculating the optimum spacing between fins. 120
5.18.3. Practical expression 120
5.18.4. Calculating the evacuated heat flux 120
5.18.5. Implementation algorithm 120
5.18.6. Illustration: optimum design of a heat sink 122
5.19. Optimum circuit-board assembly 125
5.19.1. Calculating the optimum spacing between electronic boards . . . 126
5.19.2. Heat transfer coefficient between electronic boards and air 126
5.19.3. Calculating the evacuated heat flux 127
5.19.4. Implementation algorithm 127
5.19.5. Illustration: optimum evacuation of heat generated by electronic boards 129
5.20. Superimposed forced and natural convections 130
5.20.1. Vertical-tube scenario: Martinelli-Boelter correlation 131
5.20.2. Horizontal-tube scenario: Proctor-Eubank correlation 132
5.20.3. Cylinders, disks or spheres in rotation 133

Chapter 6. Convection in Nanofluids, Liquid Metals and Molten Salts 137

6.1. Introduction. 137
6.2. Transfers in nanofluids 138
6.2.1. Physical data. 139
6.2.2. Nanofluids circulating in tubes 142
6.2.3. Nanofluids circulating within annular pipes 144
6.2.4. Superposition of natural and forced convections in nanofluids . . . 145
6.3. Transfers in liquid metals 146
6.3.1. Physical data. 146
6.3.2. Liquid metals in forced convection within cylindrical pipes 147
6.3.3. Liquid metals in forced convection within an annular space 147
6.3.4. Liquid metals flowing along a horizontal plane 149
6.3.5. Liquid metals in forced convection between two parallel planes . . 149
6.3.6. Liquid metals subject to natural convection 149
6.4. Transfers in molten salts 150
6.4.1. Physical data. 150
6.4.2. Molten salts under forced convection in laminar flow within cylindrical pipes 151

6.4.3. Molten salts under forced convection in the transition zone within cylindrical pipes 152
6.4.4. Molten salts under forced convection in turbulent flow within cylindrical pipes 153
6.5. Reading: Eugène Péclet and Lord Rayleigh 154
6.5.1. Eugène Péclet 154
6.5.2. Lord Rayleigh 155

Chapter 7. Exercises and Solutions 157

Appendices 321

Appendix 1. Database 323

Appendix 2. Regressions 385

Bibliography 389
