Introduction	xxv
Part 1. Flooding	1
Chapter 1. Modelling Flooding in Edge- or Node-weighted Graphs	3
1.1. Summary of the chapter	3
1.2. The importance of flooding	4
1.2.1. Flooding creates lakes	4
1.2.2. Flooding for controlling watershed segmentation	4
1.2.3. Flooding, razing, leveling and flattening	5
1.3. Description of the flood covering a topographic surface	6
1.3.1. Observing the same flooding on two levels of abstraction	6
1.3.2. Modeling the two scales of flooding: at the pixel level or at the region level	7
1.3.3. Modeling a flooded topographic surface as a node-weighted graph	8
1.3.4. Modeling an edge-weighted graph as a tank network	15
1.4. The relations between n-floodings and e-floodings	19
1.4.1. Modeling flooding on two scales: the equivalence of both models	19
1.5. Flooding a flowing graph	21
1.5.1. Flowing graphs: reminder	21

1.5.2. Starting from an edge-weighted graph $G[nil, \eta]$	22
1.5.3. Starting from a node-weighted graph $G[\nu, nil]$	24
1.5.4. Summarizing	24
Chapter 2. Lakes and Regional Minima	27
2.1. Summary of the chapter	27
2.2. Lakes from e-floodings and n-floodings	27
2.2.1. e-flooding of graphs $G[nil, \eta]$	27
2.2.2. n-flooding of graphs $G[\nu, nil]$	28
2.3. Regional minimum lakes and full lakes	29
2.3.1. e-floodings of graphs $G[nil, \eta]$	29
2.3.2. n-floodings of graphs $G[\nu, nil]$	30
2.4. Coherence between the definitions of lakes in $G[\nu, nil]$ and in $G[nil, \delta_{en}\nu]$	31
Chapter 3. Among all Possible Floodings, Choosing One	33
3.1. Summary of the chapter	33
3.2. Various mechanisms for selecting a particular flooding	34
3.2.1. Dominated flooding in node- and edge-weighted graphs	34
3.2.2. Dominated flooding in node- and edge-weighted graphs	36
3.2.3. Dominated flooding as a function of the ceiling function	37
3.3. The topography of dominated flooding	37
3.3.1. The regional minima of dominated flooding in an edge-weighted graph $G[nil, \eta]$	38
3.3.2. The regional minima of dominated n-flooding in node-weighted graphs $G[\nu, nil]$	39
3.3.3. Algorithmic consequences	41
3.4. Computing dominated flooding by local adjustments	43
3.4.1. The case of edge-weighted graphs $G[nil, \eta]$	43
3.4.2. The case of node-weighted graphs $G[\nu, nil]$	44
3.4.3. Software or hardware implementation of Berge's algorithm	45
Chapter 4. Flooding and Flooding Distances	49
4.1. Summary of the chapter	49
4.2. Flooding distances	49
4.2.1. The flooding distance associated with the lakes of node- or edge-weighted graphs	49
4.2.2. Characterization of the flooding distance	50

4.2.3. Flooding distances on a graph or a tree	52
4.2.4. The shortest flooding distances	53
4.2.5. Dominated flooding and flooding distances	56
4.3. The shortest path algorithms for computing dominated flooding	66
4.3.1. Computing the shortest flooding distance with the Moore–Dijkstra algorithm	66
4.4. The flooding core-expanding algorithm	75
4.4.1. The first version of the core-expanding algorithm applied to the augmented graph $G_{\hat{A}}$	76
4.4.2. The second version of the core-expanding algorithm applied to the initial graph G	78
4.4.3. The third version of the core-expanding algorithm applied to the initial graph G	79
4.5. Marker-based segmentation	81
4.5.1. The case of a node-weighted graph $G(\nu, nil)$	81
Chapter 5. Graph Flooding via Dendrograms	83
5.1. Summary of the chapter	83
5.2. Introduction	84
5.3. Dendrograms: reminder	86
5.3.1. The structure associated with an order relation	86
5.3.2. Dendrograms	87
5.3.3. Stratification index and partial ultrametric distances (PUD)	88
5.4. The hierarchy of lake zones	89
5.4.1. The lake zones of an edge-weighted graph $G(nil, \eta)$	89
5.4.2. The hierarchy of lake zones, i.e. the closed balls of χ	92
5.4.3. Representing of hierarchy of lake zones	94
5.5. The law of communicating vessels	98
5.5.1. The flooding levels in connected subgraphs and closed balls	99
5.6. Dominated flooding on the dendrogram of lake zones	100
5.6.1. Notations	100
5.6.2. Incidence of the ceiling function on the dendrogram flooding levels	100
5.6.3. Finding the flooding level of a leaf	102
5.6.4. Parallel processing for flooding the dendrogram	105
5.6.5. Strategies for flooding the dendrogram of lake zones	106

5.7. Constructing and flooding a binary dendrogram	111
5.7.1. Two dendrograms representing the same hierarchy	111
5.7.2. Constructing a binary dendrogram representing a hierarchy	112
5.7.3. Flooding a binary dendrogram	113
5.8. A derived algorithm for dominated flooding	113
5.8.1. Algorithm “ancestor-flood without constructing the dendrogram”	117
5.8.2. Illustration	117
Part 2. Modeling a Real Hydrographic Basin	119
Chapter 6. The Hydrographic Basin of a Digital Elevation Model	121
6.1. Summary of the chapter	121
6.2. Preprocessing the digital elevation model	121
6.2.1. Suppressing the spurious regional minima	121
6.2.2. Creating an ∞ – <i>steep</i> digraph	123
6.2.3. Local pruning for extracting marked rivers	126
6.2.4. Extracting all rivers	128
6.2.5. Labeling sources and rivers	129
6.2.6. Detection of crest lines	131
6.2.7. Detecting the upstream of sources	132
6.2.8. Analyzing the tree structure of rivers	133
6.2.9. Constructing the catchment zones of riverlets	137
Part 3. Watershed Partitions	139
Chapter 7. Minimum Spanning Forests and Watershed Partitions	141
7.1. Summary of the chapter	141
7.2. Flooding distance, minimum spanning trees and forests	142
7.2.1. Flooding distances	142
7.2.2. Flooding distance on the minimum spanning tree of the graph $G(\text{nil}, \eta)$	143
7.2.3. Characterizing the MST	145
7.3. Minimum spanning forests rooted in markers	146
7.3.1. Constructing the minimum spanning forest	147
7.3.2. Converting the minimum spanning forest into a minimum spanning tree	149
7.4. Watershed partitions of weighted graphs	150
7.4.1. Catchment basins and watershed partitions	150
7.4.2. Flowing paths and catchment basins	151

7.5. Minimum spanning forests rooted in the regional minima	151
7.5.1. A minimum spanning forest corresponds to each watershed partition	151
7.5.2. Inversely, each watershed partition spans a minimum spanning forest	154
7.5.3. A rather unexpected watershed partition	156
7.6. A manifold of different watershed partitions	159
7.6.1. Catchment zones and catchment basins	159
7.7. Reducing the number of watershed partitions	160
7.7.1. Minimum spanning forests of $k - steep$ or $\infty - steep$ graphs	163
7.7.2. The waterfall hierarchy	168
7.7.3. Usefulness of the waterfall hierarchy	171
Chapter 8. Marker-based Segmentation	175
8.1. Dominated flooding and minimum spanning forests	177
8.1.1. Dominated flooding	177
8.1.2. Minimum spanning forests	177
8.1.3. Illustration	178
8.1.4. Minimum spanning forests and dominated flooding	179
8.2. Constructing a minimum spanning forest rooted in the markers	183
8.2.1. Algorithms for constructing a minimum spanning forest	183
8.2.2. Increasing the selectiveness of Prim's algorithm	186
8.2.3. Marker-based segmentation of node-weighted graphs	187
8.2.4. Derived algorithms	190
8.3. Marker-based segmentation after flooding the graph	194
8.3.1. Segmenting the dominated flooding of a graph	194
8.3.2. The case of an edge-weighted graph	194
8.3.3. Constructing a $k - steep$ or $\infty - steep$ watershed partition for a node-weighted graph $G(\nu, nil)$	200
8.4. Directly constructing a marker-based $\infty - steep$ watershed partition with the core expanding algorithm	201
8.5. The early days of marker-based segmentation	202
8.5.1. The level-by-level construction of a watershed	203
8.6. A two scale marker-based segmentation	205
8.7. Instant marker-based segmentation	205
8.7.1. Why and when we need instant marker-based segmentation	205
8.7.2. The reef and cascade distance	206

8.7.3. Computing the reef and cascade distance for all pairs of nodes in $G(nil, \eta)$	209
8.7.4. Computing the smallest reef and cascade distances between all couples of nodes in a graph	212
Conclusion	217
Appendix	227
