Preface ix

Chapter 1. Tools for Bioreactor Modeling and Simulation 1

1.1. Introduction. 1
1.2. Process engineering approach 2
1.2.1. Current modeling 2
1.2.2. Multiphase modeling. 6
1.2.3. Conclusion on the process engineering approach 18
1.3. Multiphase fluid mechanics approach 19
1.3.1. General Euler equations 20
1.3.2. Eulerian or Lagrangian approach for the biological phase? 22
1.3.3. Conclusion on the computational fluid dynamics approach 26

Chapter 2. Mixing and Bioreactions 29

2.1. Introduction. 29
2.2. Mixing and reactions 31
2.2.1. State of the problem 31
2.2.2. Characterization of mixing 33
2.2.3. Mixing mechanisms 44
2.2.4. Characteristic mixing times 47
2.2.5. Contribution of aeration to macromixing 48
2.2.6. Reaction characteristic time. 52
2.3. Interaction between mixing and bioreaction 55
2.3.1. Competition between mixing and chemical reaction. 55

2.3.2. Competition between mixing and biological reaction . . . 56
2.3.3. Spatial approach to the micromixing problem . . . 60
2.4. Analysis and modeling of couplings between mixing and bioreaction . . . 65
2.4.1. Link between the segregation state and calculation of the apparent rate of a simple biological reaction . . . 66
2.4.2. Modeling of non-perfectly mixed bioreactors. . . . 71
2.4.3. Approach based on a mixing model . . . 74
2.5. Conclusion . . . 81

Chapter 3. Assimilation, Transfer, Equilibrium . . . 85

3.1. Introduction. . . . 85
3.2. Transfers between phases . . . 86
3.2.1. Gas–liquid transfer . . . 86
3.2.2. Liquid–microorganisms transfer . . . 90
3.2.3. Synthesis and conclusion . . . 96
3.3. Equilibrium or dynamic responses: experimental illustrations . . . 97
3.3.1. Dynamic response in terms of growth rate . . . 98
3.3.2. Dynamic response for the assimilation . . . 104
3.3.3. Dynamic response of the metabolism . . . 108
3.4. Equilibrium models, dynamic models . . . 113
3.4.1. Unstructured kinetic model: equilibrium model or zero-equation model . . . 114
3.4.2. Structured kinetic model. . . . 116
3.4.3. Metabolic model . . . 120
3.5. Confrontation of models with experimental data . . . 122
3.5.1. Response of a chemostat to an increase in the dilution rate . . . 123
3.6. Problem of coupling between a biological model and hydrodynamic model . . . 134
3.6.1. Closure of the liquid–cell transfer term . . . 134
3.6.2. Problem of transport and mixing . . . 139
3.7. Conclusion . . . 143

Chapter 4. Biological Population Balance . . . 145

4.1. Introduction. . . . 145

4.2. General population balance equation 147
4.2.1. Definitions 147
4.2.2. What are the links between structured models and population balances? 156
4.3. Illustrative examples 159
4.3.1. Models based on mass discrimination 159
4.3.2. Differentiation by age 171
4.3.3. Differentiation by intracellular composition 178
4.3.4. Coupling with the bioreactor 179

Bibliography 189
