**Introduction** . . . . . xi

**Chapter 1. The Thermal Worm Model to Represent Entropy–Exergy Duality** . . . . . 1

1.1. A fractal and diffusive approach to entropy and exergy. . . . . 1
1.1.1. The filamentary thermal worm model of exergy . . . . . 1
1.1.2. The geometrical Carnot factor and the temperature of a filamentary worm . . . . . 3
1.1.3. The T-like filamentary worm . . . . . 6
1.2. A granular model of energy: toward the entropy and the exergy of a curve . . . . . 7
1.2.1. The model of granular energy: the concept of ergon . . . . . 7
1.2.2. Exergy and anergy of an ergon: the entropic angle of an energy . . 7
1.2.3. An elementary ergon discharged in a field of temperature T: the thermal puff time of energy . . . . . 9
1.2.4. The granular energy model applied to the hydraulic analogy of Lazare and Sadi Carnot: entropy and action of energy . . . . . 11
1.2.5. Exergy and anergy of a curve. . . . . 15
1.2.6. Examples of Carnot factor of some curves . . . . . 18
1.3. The thermal worm model of *entropy–exergy duality* . . . . . 19
1.3.1. Entropic skins to describe irreversibilities and entropy–exergy duality. . . . . 19
1.3.2. The 2D worm model . . . . . 21
1.3.3. The 3D worm model: the coefficient of entropic dispersion. . . . . 22
1.3.4. Entropic structure of a steady-state heat flux. . . . . 23
1.3.5. 2D worm entropic dispersion of a steady heat flux . . . . . 24
1.3.6. 3D worm entropic dispersion of a steady heat flux . . . . . 25
1.4. The 2D worm model . . . . . 26
1.4.1. The isothermal 2D worm . . . . . 26

1.4.2. Exergy destruction between two 2D worms . . . . . 27
1.4.3. The non-isothermal 2D worm . . . . . 28
1.4.4. The 2D worm of a linear profile of temperature: method 1 . . . . . 31
1.4.5. 2D worm displaying a linear temperature profile: method 2. . . . . 35
1.5. The 3D thermal worm-like model. . . . . 36
1.5.1. The isothermal 3D worm model . . . . . 36
1.5.2. The entropic angle of energy . . . . . 39
1.5.3. The non-isothermal 3D worm model . . . . . 40
1.5.4. Table to recapitulate . . . . . 43
1.5.5. A link with the phenomenon of intermittency in fully developed turbulence. . . . . 44
1.5.6. Longitudinal diffusion and lateral diffusion in the worm-like model . . . . . 46

**Chapter 2. Black Hole Entropy and the Thermal Worm Model** . . . . 49

2.1. Entropy of a black hole: the Bekenstein–Hawking temperature . . . . . 49
2.1.1. Introduction: a geometric entropy for black holes. . . . . 49
2.1.2. Gravitational and quantum diffusivities: longitudinal and lateral diffusivities of a black hole?. . . . . 52
2.1.3. The existence of an absolute minimum temperature which is not 0 . . . . . 54
2.2. The thermal worm model of black holes. . . . . 56
2.2.1. Entropic thermal worm representation of a black hole . . . . . 56
2.2.2. Temperature of the worm and temperature of the black hole . . . . 58
2.2.3. The thickness of the horizon of a black hole . . . . . 59
2.2.4. The quantum variation of the temperature in a black hole . . . . . 60
2.3. Carnot representation of black holes . . . . . 62
2.3.1. Black hole as a reversible power cycle . . . . . 62
2.3.2. Black hole as a reversible refrigeration cycle . . . . . 62
2.3.3. The quantum interaction velocity . . . . . 63
2.3.4. Relaxation time of thermal inhomogeneities: the “thermal puff time” of energy in a black hole. . . . . 65
2.3.5. From Planck’s constant and Boltzmann’s constant toward Brillouin’s constant b = h/k. . . . . 67
2.3.6. Black hole physics: a deep and fascinating representation of the finiteness of our world. . . . . 68

**Chapter 3. The Entropic Skins of Black-Body Radiation: a Geometrical Theory of Radiation** . . . . . 71

3.1. Intermittency of black-body radiation . . . . . 71
3.1.1. Black-body radiation: Wien’s law, Rayleigh–Jeans’ law and Planck’s law . . . . . 71
3.1.2. The spectral volume fraction and the intermittency of radiation . . 73

3.1.3. A simple derivation of $u(\nu) = 8\pi \frac{\nu^2}{c^3} E_\nu$ using an analogy with fully developed turbulence . . . . . 75
3.1.4. A simple understanding of the importance of the ratio ν/T in the black-body problem . . . . . 76
3.1.5. The interacting length and interaction time of a photon and its scale-entropy. . . . . 77
3.1.6. The interacting length of a fermion and its scale-entropy . . . . . 81
3.1.7. Summary of the chapter . . . . . 82
3.2. Generalized RJ law based on a scale-dependent fractal geometry. . . . 82
3.2.1. Radiation as stationary waves in a box: the Rayleigh description. . . . . 83
3.2.2. First case: uniform distribution of modes in phase-space – the RJ theory . . . . . 84
3.2.3. Second case: fractal distribution of modes in phase space . . . . . 86
3.2.4. General case: the fractal dimension is mode dependent . . . . . 87
3.2.5. Conclusion . . . . . 88
3.3. Fluctuations and energy dispersion in black-body radiation . . . . . 88
3.3.1. Planck's derivation using the second-order derivative of entropy: the "lucky guess". . . . . 88
3.3.2. Planck's entropy . . . . . 91
3.3.3. Planck's entropy, Planck's counting of complexions and Boltzmann's theory . . . . . 93
3.3.4. Planck's entropy and the scale-entropy of a radiative field . . . . . 97
3.3.5. Equivalent chemical potential of a Boltzmann distribution . . . . . 99
3.3.6. Graphical method to represent Boltzmann's counting . . . . . 100
3.3.7. What is the fundamental status of the second order derivative of entropy relative to energy? Variance and the dispersion factor of radiative energy. . . . . 103
3.3.8. The fluctuations and the dispersion of energy . . . . . 108
3.3.9. The dispersion factor interpreted by the worm model . . . . . 111
3.3.10. An heuristic thermodynamical uncertainty relation from the thermal worm model . . . . . 112
3.4. A scale-entropy diffusion equation for black-body radiation. . . . . 114
3.4.1. Spacions and scale-entropy . . . . . 114
3.4.2. Scale-entropy diffusion equation. . . . . 116
3.4.3. Pure truncated fractal case and parabolic scaling . . . . . 119
3.4.4. Exponential scaling: the scale-entropy sink is a fraction of the entropy production of a photon . . . . . 119
3.4.5. Summary. . . . . 122
3.5. Spectral fractal dimensions and scale-entropy of black-body radiation . . . . . 122

3.5.1. Fractal skins of black-body radiation . . . . . 122
3.5.2. Spectral fractal dimensions $D_x$ of black-body radiation . . . . . 124
3.5.3. Spectral evolution of the scale-entropy sink b(x) . . . . . 125
3.5.4. Point of minimum scale-entropy sink . . . . . 127
3.5.5. Minimum scale-entropy sink and CMB . . . . . 129
3.5.6. Determination of the inner cut-off scale: a scale for which D(x) = 2 . . . . . 129
3.5.7. Average value of the scale-entropy sink . . . . . 130
3.6. Conclusion . . . . . 132

**Chapter 4. Non-extensive Thermodynamics, Fractal Geometry and Scale-entropy** . . . . . 135

4.1. Tsallis entropy in non-extensive thermostatistics. . . . . 135
4.2. Two physical systems leading to Tsallis entropy: a simple interpretation of the entropic index . . . . . 138
4.2.1. Work produced by the isothermal growth of a fractal volume . . . 139
4.2.2. Mass decay of a fractal system . . . . . 142
4.3. Non-extensive thermostatistics, scale-dependent fractality and Kaniadakis entropy . . . . . 144
4.3.1. Decaying process of a fractal system submitted to internal cohesion pressure . . . . . 144
4.3.2. The Kaniadakis κ-statistics and Kaniadakis entropy . . . . . 147
4.3.3. Conclusion on non-extensive thermodynamics and fractal geometry and scale-entropy. . . . . 149

**Chapter 5. Finite Physical Dimensions Thermodynamics** . . . . . 151

5.1. A brief history of finite physical dimensions thermodynamics . . . . . 151
5.2. Transfer phenomena by FPDT . . . . . 154
5.2.1. Series model of insulation: thermal resistances in series . . . . . 154
5.2.2. Parallel model of insulation: thermal resistances in parallel . . . . . 158
5.2.3. Generalization . . . . . 160
5.2.4. Partial conclusion . . . . . 161
5.3. Energy conversion by FPDT. . . . . 162
5.3.1. Carnot cycle and thermodynamics of equilibrium. . . . . 163
5.3.2. The non-adiabatic endoreversible Carnot engine . . . . . 163
5.3.3. The adiabatic endoreversible Carnot engine . . . . . 164
5.3.4. The adiabatic non-reversible Carnot engine . . . . . 165
5.3.5. The non-reversible Carnot engine with thermal losses . . . . . 167
5.3.6. Generalization of previous results . . . . . 168
5.4. Extension to complex systems: cascades of endoreversible Carnot engines . . . . . 169
5.4.1. Cascade of power Carnot engines . . . . . 169

5.4.2. Thermodynamic model in finite dimensions . . . . . 170
5.4.3. Optimization of the cascade. . . . . 171
5.4.4. Cascade with N endoreversible machines . . . . . 173
5.5. Time dynamics of Carnot engines . . . . . 174
5.5.1. Reversible thermal transfer between source and sink. . . . . 174
5.5.2. Finite transfer between source and irreversible engine . . . . . 176
5.6. Conclusions on FPDT. . . . . 179

**Chapter 6. A Scale-Dependent Fractal and Intermittent Structure to Describe Chemical Potential and Matter Diffusion** . . . 181

6.1. Defining and quantifying the diffusion of matter through chemical potential . . . . . 181
6.1.1. The chemical potential. . . . . 181
6.1.2. Fundamental equations . . . . . 183
6.1.3. Condition of chemical equilibrium. . . . . 184
6.2. Topic scales and scale-entropy of a set of particles . . . . . 186
6.2.1. Topic volume and topic scales of a particle . . . . . 186
6.2.2. Scale-entropy of a set of particles . . . . . 188
6.2.3. Scale-entropy of a fractal set . . . . . 190
6.3. Entropy and chemical potential of an ideal gas by Sackur–Tetrode theory . . . . . 192
6.3.1. Entropy of monoatomic ideal gases using Sackur–Tetrode theory . . . . . 192
6.3.2. Chemical potential using Sackur–Tetrode theory . . . . . 195
6.3.3. Chemical potential of a mixture using Sackur–Tetrode theory . . . 196
6.4. Entropy of a set of particles described through topic scales and scale-entropy . . . . . 198
6.4.1. Waving and clustering entropies of a set of particles . . . . . 198
6.4.2. Application to a two-component mixture: the clustering entropy of a mixture . . . . . 200
6.4.3. Application to heterogeneous solids: clustering entropy of heterogeneity . . . . . 203
6.5. Fractal and scale-dependent fractal geometries to interpret and calculate the chemical potential . . . . . 204
6.5.1. Chemical potential interpreted via scale-entropy, expelling potential and clustering entropy . . . . . 204
6.5.2. Intermittent and multiscale nature of chemical potential: the fractal case . . . . . 205
6.6. The intermittency parameter and clustering entropy of particles in the fractal case . . . . . 206
6.6.1. Clustering entropy of a single i-particle belonging to a fractal set of particles . . . . . 206
6.6.2. Clustering entropy for the whole ith component (fractal case) . . . 208

6.6.3. Clustering entropy of the mixture (fractal case) . . . . . 209
6.6.4. The case of two-components fractally distributed in a mixture . . . 209
6.6.5. Fractal dimension of the maximum clustering entropy case . . . . . 210
6.6.6. Equifractality condition of equilibrium . . . . . 211
6.6.7. Entropy jump by adding a particle in the fractal case . . . . . 211
6.7. The clustering entropy and chemical potential in the parabolic fractal case . . . . . 212
6.7.1. Clustering entropy of an individual i-particle in parabolic fractal case . . . . . 212
6.7.2. Clustering entropy for the *i*th component in parabolic fractal case . . . . . 213
6.7.3. Clustering entropy of the mixture in parabolic fractal case . . . . . 213
6.8. Summing up formulas and conclusion . . . . . 214

**Conclusion** . . . . . 219
