Preface	ix
Introduction	xi
Chapter 1. Fundamental Equations of Conduction	1
1.1. Introduction.	1
1.2. General equations of conduction	2
1.2.1. Expressing the term $(I - O)$	2
1.2.2. The term “generation”	4
1.2.3. The term “accumulation”	4
1.2.4. Energy balance equation.	5
1.3. Equations of conduction in different coordinate systems	7
1.3.1. When λ is not constant.	8
1.3.2. When λ is constant	9
1.3.3. Simplified cylindrical and spherical coordinates	9
1.3.4. One-dimensional conduction	10
1.4. Reading: metal tempering	10
Chapter 2. Conduction in Steady State and Applications	13
2.1. Introduction.	13
2.2. Equations of conduction in steady state	13
2.2.1. Expressions in the different coordinate systems	14
2.2.2. Simplifications in the case of one-dimensional conduction	14
2.3. Applying to single-layer walls.	15
2.4. Concept of thermal resistance	16
2.5. Applying to composite or multi-layer walls.	17
2.6. Applying to cylindrical walls	20

2.7. Applying to composite cylindrical walls	23
2.8. Applying to spherical walls	24
2.9. Case of composite spherical walls	26
2.10. Convective-type boundary conditions: case of a single-layer wall. . .	28
2.10.1. Internal convection resistance	29
2.10.2. External convection resistance	29
2.10.3. Conduction resistance	29
2.10.4. Expressing the flux as a function of T_i and T_e	29
2.11. Composite walls with convective boundary conditions	32
2.11.1. Illustration: calculating heat losses through the walls of an industrial furnace	33
2.12. Parallel resistances with convective boundary conditions.	38
2.12.1. Illustration: composite wall with parallel thermal resistances . . .	39
2.13. Composite cylindrical pipes with convective boundary conditions . .	47
2.13.1. Illustration: transfer through a composite cylindrical wall	48
2.14. Composite spherical installations with convective boundary conditions	51
Chapter 3. Conduction Applications in Thermal Insulation	55
3.1. Introduction.	55
3.2. The main insulation materials	56
3.2.1. Cork.	56
3.2.2. Sawdust and wood wool.	57
3.2.3. Hemp	57
3.2.4. Cellulose	58
3.2.5. Glass and rock wools.	59
3.2.6. Polyurethane foam	61
3.2.7. Expanded polystyrene	62
3.3. Choosing a suitable thermal insulator	64
3.3.1. Optimum heat-lagging thickness for plane walls	66
3.3.2. Heat-lagging cylindrical jackets	75
3.3.3. Heat-lagging spherical containers	87
Chapter 4. Conduction Applications in the Reduction of Heat Losses in Construction	99
4.1. Introduction.	99
4.2. Thermal building regulations	100
4.3. Calculating losses through building partitions	105
4.3.1. Expressing the flux of energy losses.	105
4.3.2. Notations specific to building energy efficiency calculations	106
4.3.3. Calculating losses through composite partitions: walls, floors and roofs	107

4.4. Calculating losses through glass walls	109
4.4.1. Illustration: minimum thermal resistances for the walls of a hotel to be constructed	112
4.5. Optimizing energy choices for building heat insulation	116
4.5.1. Illustration: energy losses through the windows of a building.	118
4.6. Reading: financing energy renovations, innovative schemes.	123
Chapter 5. Conduction with Energy Generation	125
5.1. Introduction.	125
5.2. Plane conductor with generation	125
5.2.1. Illustration: generation in a plane conductor	127
5.3. Cylindrical conductor with generation	133
5.3.1. Illustration: thermal technology in the core of a nuclear reactor	135
5.4. Conduction in rectangular fins.	142
5.4.1. Illustration: gain in efficiency through use of a fin	147
Chapter 6. Conduction in Transient State	149
6.1. Introduction.	149
6.2. Methods for resolving the conduction equation	150
6.3. Discretizing the heat equation	151
6.4. Implementing the discrete heat equation.	154
6.4.1. Resolution algorithm.	154
6.4.2. Choosing the Δx and Δt increments	155
6.4.3. Simplifications in the case of stationary state	155
6.4.4. Simplifications in the two-dimensional case	156
6.4.5. Simplifications in the one-dimensional case	160
6.5. Developing precise analytical solutions in the one-dimensional case.	160
6.6. Approximate analytical solutions	165
6.6.1. For $Bi = 0$	166
6.6.2. For $0 < Bi < 0.1$	166
6.6.3. For $Bi = 0.1$	170
6.6.4. For $Bi > 0.1$	171
6.7. Graphical method for solving the heat equation	174
6.7.1. Temperature profile at center of solid	176
6.7.2. Using charts to determine temperature profile at center of solid	179
6.7.3. Temperature distribution inside the solid	179
6.7.4. Using Figures 6.8 to 6.10 to determine the temperature distribution inside the solid	182
6.7.5. Calculating the fluxes exchanged	182
6.8. Case study: comparison of graphical and numerical methods	196

6.8.1. Resolution using the graphical method	197
6.8.2. Resolution using the numerical method.	202
6.8.3. Comparison of the numerical and graphical results	205
6.8.4. Comparison with the analytical solution	206
6.9. Reading: Jean-Baptiste Biot	212
Chapter 7. Exercises and Solutions	215
Appendix. Database	381
Bibliography	421
Index	433
