

Table of Contents

Foreword	ix
Preface	xi
Chapter 1. Radio Propagation	1
1.1. Free-space loss link budget and capacity	2
1.2. Link budget and free-space loss	7
1.3. Linear expression of the Okumura–Hata model	9
1.4. Frequency, distance and propagation model	11
1.5. Link budget and diffraction	13
1.6. Link budget and refraction	15
1.7. Link budget and diffusion	18
1.8. Frequency and time selectivity	20
1.9. Doppler effect	21
Chapter 2. F/TDMA and GSM	23
2.1. Maximum transmitter–receiver distance	24
2.2. Extended maximum transmitter–receiver distance	26
2.3. Reuse distance, interference reduction factor K and regular pattern	26
2.4. Radio resources dimensioning in GSM	32
2.5. Link budget in an isolated GSM cell	33

2.6. Deployment of a GSM network along a highway	36
2.7. GSM network dimensioning and planning in a rural area	41
2.8. GSM network dimensioning and planning in an urban area.	44
2.9. SMS transmission in a GSM network	46
2.10. Frequency reuse pattern determination.	48
2.11. Traffic and Erlang for GSM cell dimensioning	50
2.12. Signal to noise plus interference ratio	52
Chapter 3. CDMA and UMTS	59
3.1. Spreading and CDMA	63
3.2. Hadamard spreading codes: a perfect orthogonality between the users?	64
3.3. Relation between E_b/N_0 and the reception threshold in UMTS networks	69
3.4. Required number of codes in CDMA	70
3.5. UMTS link budget	71
3.6. Cell breathing in UMTS networks	77
3.7. Intersite distance calculation in UMTS networks for different frequency reuse patterns	80
3.8. Case study in UMTS networks.	83
Chapter 4. OFDM and LTE	95
4.1. Useful throughput of an OFDM waveform.	96
4.2. OFDM and PAPR	100
4.3. Frequency selectivity and OFDM dimensioning	104
4.4. OFDM dimensioning.	106
4.5. OFDM dimensioning for 4G networks and data rate evaluations.	107
4.6. LTE data rates evaluation	110
4.7. LTE link budget	113

4.8. LTE link budget taking into account the number of users	120
4.9. Modulation-coding scheme relation, spectral efficiency and SINR in LTE networks	123
Chapter 5. MIMO and Beamforming	129
5.1. Beamforming and signal-to-noise ratio	133
5.2. Space diversity and chi-square distribution	140
5.3. MIMO and capacity	149
Chapter 6. UWB	155
6.1. Impulse UWB	157
6.2. UWB and OFDM	161
6.3. Link budget for UWB transmission	163
Chapter 7. Synchronization	167
7.1. Cramer–Rao bound	168
7.2. Modified Cramer–Rao bound	170
7.3. Constant parameter estimation	170
7.4. Radio burst synchronization	174
7.5. Phase estimation for QPSK modulation	176
Chapter 8. Digital Communications Fundamentals	179
8.1. Review of signal processing for signal-to-noise ratio	179
8.2. Review of digital modulations	179
8.3. Review of equalization	180
8.4. Signal-to-noise ratio estimation	181
8.5. ASK 2 modulation error probability	184
8.6. Spectral occupancy, symbol rate and binary throughput	187
8.7. Comparison of two linear digital modulations	189
8.8. Comparison of two-PSK modulation and power evaluations	191

8.9. Zero-forcing linear equalization	194
8.10. Minimum mean square error linear equalization	196
8.11. Noise factor in equipments	200
8.12. Data rate calculations	203
Chapter 9. Erlang B Tables	205
Bibliography	209
Index	211
