Preface ix

Introduction xi

Chapter 1. Approximation of Continuous Functions in Normed Spaces 1

1.1. Introduction 1
1.2. Some remarks on the meaning of the word “simple”. Choosing the approximation 2
1.2.1. Splines 6
1.3. The choice of the norm in order to specify the error 8
1.4. Optimality with respect to a norm 12
1.4.1. Existence of an optimal solution 12
1.4.2. Uniqueness of the optimal solution 13
1.4.3. Examples 15
1.5. Characterizing the optimal solution 18
1.5.1. The Hilbertian case 18
1.5.2. The non-Hilbertian case 21
1.5.3. Optimization, L_p norms and robustness 24

Chapter 2. Chebyshev Systems 27

2.1. Introduction 27
2.2. From the classical polynomials to the generalized ones 28
2.2.1. Examples of Chebyshev systems 32
2.3. Properties of a Chebyshev system 34
2.3.1. Vector-type properties 34
2.3.2. Chebyshev systems and interpolation 40
2.3.3. Roots of the generalized polynomials 44

Chapter 3. Uniform Approximations in a Normed Space 45

3.1. Introduction 45
3.2. Characterization of the best uniform approximation in a normed space 46
3.2.1. The Haar–Kolmogorov theorem 46
3.2.2. The generalized Borel – Chebyshev theorem 58
3.2.3. Oscillation properties of the best uniform approximation 64

Chapter 4. Calculation of the Best Uniform Approximation in a Chebyshev System 69

4.1. Some preliminary results 69
4.2. Functional continuity of the approximation scheme 71
4.3. Property of the uniform approximation on a finite collection of points in $[a, b]$ 74
4.4. Algorithm of de la Vallée Poussin 80
4.5. Algorithm of Remez 80

Chapter 5. Optimal Extrapolation Design for the Chebyshev Regression 85

5.1. Introduction 85
5.2. The model and Gauss-Markov estimator 87
5.2.1. Description of the dataset 88
5.3. An expression of the extrapolated value through an orthogonalization procedure 91
5.4. The Gauss-Markov estimator of the extrapolated value 93
5.5. The Optimal extrapolation design for the Chebyshev regression 97
5.5.1. The support of the optimal design 97
5.5.2. The frequencies of the optimal design 102
5.5.3. Identification of the optimal design 104

Chapter 6. Optimal Design for Linear Forms of the Parameters in a Chebyshev Regression 107

6.1. Outlook and notations 107
6.2. Matrix of moments 113
6.3. Estimable forms 118
6.4. Matrix of moments and Gauss-Markov estimators of a linear form 119
6.4.1. Matrices of moments and estimable linear forms 119
6.4.2. An alternative form of the lower bound of the variance of the estimator of the $\mathbf{c}$ form 129
6.5. Geometric interpretation of estimability: Elfving set 133

6.5.1. Estimable forms and a convex subset of the regression range; the Elfving set . . . 133
6.5.2. Geometry of the Elfving set . . . 137
6.5.3. The relation between cylinders and the variance of the estimator of the **c**-form . . . 142
6.5.4. Lower bound for the variance . . . 143
6.5.5. The lower bound can be achieved . . . 145
6.6. Elfving theorem . . . 148
6.7. An intuitive approach to Elfving theorem . . . 154
6.8. Extension of Hoel–Levine result: optimal design for a linear **c**-form . . . 160

Chapter 7. Special Topics and Extensions . . . 169

7.1. Introduction . . . 169
7.2. The Gauss–Markov theorem in various contexts . . . 170
7.2.1. The Gauss–Markov theorem for linear transformations of the parameter under i.i.d. errors . . . 170
7.2.2. Gauss–Markov theorem for heteroscedastic models with correlation . . . 174
7.2.3. The Gauss–Markov theorem and the Loewner order on quadratic forms . . . 176
7.3. Criterions for optimal designs . . . 178
7.3.1. Introduction . . . 178
7.3.2. Some specific criterions . . . 181
7.4. G–optimal interpolation and extrapolation designs for the Chebyshev regression . . . 188
7.4.1. Criteria for optimality . . . 188
7.4.2. Design with minimal uniform variance for a Chebyshev regression . . . 203
7.5. Some questions pertaining to the model . . . 209
7.5.1. Linear heteroscedastic models . . . 209
7.5.2. Nonlinear models, estimators and optimal designs . . . 216
7.6. Hypotheses pertaining to the regressor . . . 225
7.6.1. Regressor in a linear space with unknown finite dimension . . . 225
7.6.2. An extension to the case of analytic regressors . . . 227
7.6.3. On the choice of the degree of the polynomial model . . . 229
7.7. A few questions pertaining to the support of the optimal design for extrapolation . . . 229
7.7.1. Preliminary results and notation . . . 230
7.7.2. Optimal designs whose support is the Chebyshev set of points . . . 235
7.8. The proofs of some technical results . . . 239
7.8.1. Proof of proposition 7.1 . . . 239
7.8.2. Proof of theorem 7.17 . . . 241

Chapter 8. Multivariate Models and Algorithms 249

8.1. Introduction 249
8.2. Multivariate models 250
8.2.1. Notation 250
8.2.2. Predictors and their variance 254
8.2.3. Some construction of multivariate models 255
8.3. Optimality criterions and some optimal designs 257
8.3.1. Criterions for optimality and characterization of the optimal design 257
8.3.2. $D-$optimality, direct sum and tensor product 262
8.4. Algorithms 266
8.4.1. General aspects 266
8.4.2. Specific algorithms 271
