Foreword 1	ix
Foreword 2	xi
Preface	xv
Nomenclature	xxi
Chapter 1. Mathematical Concepts	1
1.1. Tensors in Cartesian coordinates	1
1.1.1. Tensor operations	2
1.1.2. Tensor derivatives	5
1.1.3. Vector and second-order tensor properties	7
1.1.4. Voigt notation for second- and fourth-order tensors	8
1.1.5. Special notation for isotropic fourth-order tensors	16
1.2. Tensors in curvilinear coordinates	17
1.2.1. Tensor operations	19
1.2.2. Tensor derivatives	22
1.2.3. Transformations between coordinate systems	23
1.2.4. Several proofs in tensor calculus	26
1.2.5. Cylindrical and spherical coordinates	32
Chapter 2. Continuum Mechanics and Constitutive Laws	37
2.1. Kinematics	37
2.2. Kinetics	40

2.3. Divergence theorem and Reynolds transport theorem	41
2.4. Conservation laws	43
2.4.1. Conservation of mass	43
2.4.2. Conservation of linear momentum	44
2.4.3. Conservation of angular momentum	45
2.4.4. Conservation of energy	46
2.4.5. Entropy inequality	48
2.4.6. Reduction to small deformations	50
2.5. Constitutive law	50
2.5.1. Thermodynamics considerations	51
2.5.2. Dissipation potentials	58
2.5.3. Examples of constitutive laws	62
2.6. Parameter identification for an elastoplastic material	79
2.6.1. Identification of mechanical parameters	81
2.6.2. Identification of thermal parameters	83
2.6.3. Identification of thermomechanical parameters	86
Chapter 3. Computational Methods	89
3.1. Thermomechanical problem in weak form	89
3.2. Computational procedure	92
3.2.1. Preliminaries	93
3.2.2. Finite element solution	95
3.2.3. Constitutive law algorithm	95
3.2.4. Tangent moduli algorithm	99
3.3. General algorithm in thermoelasticity	101
3.4. General algorithms in elastoplasticity	102
3.4.1. Closest point projection	104
3.4.2. Convex cutting plane	106
3.4.3. Viscoplasticity and other phenomena	108
3.5. Special algorithms in viscoelasticity	109
3.6. Numerical applications	111
3.6.1. Thermoelastoplastic material	111
3.6.2. Viscoelastic material	114
Chapter 4. Concepts for Heterogeneous Media	117
4.1. Preliminaries	119
4.2. Homogenization - engineering approach	120

4.2.1. Hill's lemma and Hill–Mandel theorem: mechanical problem	124
4.2.2. Hill's lemma and Hill–Mandel theorem: thermal problem	127
4.2.3. Divergence and curl properties for periodic fields	129
4.3. Mathematical homogenization of periodic media	130
4.3.1. Approximating deformation functions	134
4.3.2. Compensated compactness and two-scale convergence	138
4.3.3. General results from mathematical homogenization	142
Chapter 5. Composites with Periodic Structure	145
5.1. Thermomechanical processes	148
5.1.1. Kinematics	149
5.1.2. Kinetics	150
5.1.3. Conservation laws	150
5.2. Constitutive law	157
5.2.1. Linearized, incremental formulation	163
5.3. Discussion	172
5.4. Example: multilayered composite	176
5.4.1. Unit cell problem: microscopic fields	176
5.4.2. Unit cell problem: concentration tensors for obtaining the effective tangent moduli	180
5.5. Numerical applications	183
5.5.1. 1-D mechanical problem of a multilayered composite	183
5.5.2. 1-D thermal problem of a multilayered composite	186
5.5.3. 3-D mechanical analysis: elastoplastic multilayered composite	189
5.5.4. Fully coupled 3-D thermomechanical analysis: viscoplastic multilayered composite	191
Chapter 6. Composites with Random Structure	195
6.1. Inclusion problems	197
6.1.1. Eshelby's inclusion problem	197
6.1.2. Inhomogeneity problem and Eshelby's equivalent inclusion principle	199
6.1.3. Inhomogeneous inhomogeneity problem: thermoelastic case	203
6.1.4. Inhomogeneity problem for thermal conductivity	204

6.2. Eshelby-based approaches: Linear thermoelastic composites	206
6.2.1. Random media with distinct phases and concentration tensors	206
6.2.2. Mori-Tanaka method	210
6.2.3. Self-consistent method	212
6.2.4. Ponte-Castañeda and Willis method	213
6.3. Nonlinear thermomechanical processes	218
6.3.1. Microscale problem	218
6.3.2. Macroscale problem	220
6.4. Discussion	220
6.5. Example: composite with spherical particles	224
6.5.1. Mori-Tanaka	225
6.5.2. Self-consistent	228
6.6. Numerical applications	230
6.6.1. Isotropic matrix with isotropic spherical particles: thermoelastic case	231
6.6.2. Isotropic matrix with isotropic fibers: elastic case	232
6.6.3. Isotropic matrix with isotropic elastoplastic spherical particles	234
Appendices	237
Appendix 1	239
Appendix 2	247
Bibliography	257
Index	271
