

Table of Contents

Preface	xvii
Notation	xxi
Chapter 1. Introduction to Tomography	1
Pierre GRANGEAT	
1.1. Introduction	1
1.2. Observing contrasts	2
1.3. Localization in space and time	7
1.4. Image reconstruction	9
1.5. Application domains	12
1.6. Bibliography	17
 PART 1. IMAGE RECONSTRUCTION	 21
Chapter 2. Analytical Methods	23
Michel DEFRISE and Pierre GRANGEAT	
2.1. Introduction	23
2.2. 2D Radon transform in parallel-beam geometry	25
2.2.1. Definition and concept of sinogram	25
2.2.2. Fourier slice theorem and data sufficiency condition	26
2.2.3. Inversion by filtered backprojection	27
2.2.4. Choice of filter	28
2.2.5. Frequency–distance principle	31
2.3. 2D Radon transform in fan-beam geometry	32
2.3.1. Definition	32
2.3.2. Rebinning to parallel data	33
2.3.3. Reconstruction by filtered backprojection	33
2.3.4. Fast acquisitions	34

2.3.5. 3D helical tomography in fan-beam geometry with a single line detector.	35
2.4. 3D X-ray transform in parallel-beam geometry	37
2.4.1. Definition	37
2.4.2. Fourier slice theorem and data sufficiency conditions	38
2.4.3. Inversion by filtered backprojection	39
2.5. 3D Radon transform.	40
2.5.1. Definition	40
2.5.2. Fourier slice theorem.	41
2.5.3. Inversion by filtered backprojection	41
2.6. 3D positron emission tomography	42
2.6.1. Definitions	42
2.6.2. Approximate reconstruction by rebinning to transverse slices	42
2.6.3. Direct reconstruction by filtered backprojection.	45
2.7. X-ray tomography in cone-beam geometry	46
2.7.1. Definition	46
2.7.2. Connection to the derivative of the 3D Radon transform and data sufficiency condition.	46
2.7.3. Approximate inversion by rebinning to transverse slices	49
2.7.4. Approximate inversion by filtered backprojection	50
2.7.5. Inversion by rebinning in Radon space	52
2.7.6. Katsevich algorithm for helical cone-beam reconstruction	53
2.8. Dynamic tomography	54
2.8.1. Definition	54
2.8.2. 2D dynamic Radon transform	54
2.8.3. Dynamic X-ray transform in divergent geometry	55
2.8.4. Inversion	55
2.9. Bibliography	58
Chapter 3. Sampling Conditions in Tomography	63
Laurent DESBAT and Catherine MENNESSIER	
3.1. Sampling of functions in \mathfrak{R}^n	63
3.1.1. Periodic functions, integrable functions, Fourier transforms	63
3.1.2. Poisson summation formula and sampling of bandlimited functions	65
3.1.3. Sampling of essentially bandlimited functions.	66
3.1.4. Efficient sampling	68
3.1.5. Generalization to periodic functions in their first variables	70
3.2. Sampling of the 2D Radon transform	71
3.2.1. Essential support of the 2D Radon transform	71
3.2.2. Sampling conditions and efficient sampling	73
3.2.3. Generalizations	74
3.2.3.1. Vector tomography	74

3.2.3.2. Generalized, rotation invariant Radon transform	76
3.2.3.3. Exponential and attenuated Radon transform	77
3.3. Sampling in 3D tomography.	79
3.3.1. Introduction	79
3.3.2. Sampling of the X-ray transform.	80
3.3.3. Numerical results on the sampling of the cone-beam transform . .	84
3.4. Bibliography	85
Chapter 4. Discrete Methods	89
Habib BENALI and Françoise PEYRIN	
4.1. Introduction.	89
4.2. Discrete models	90
4.3. Algebraic methods.	92
4.3.1. Case of overdetermination by the data	92
4.3.1.1. Algebraic methods based on quadratic minimization.	92
4.3.1.2. Algorithms	93
4.3.2. Case of underdetermination by the data.	96
4.3.2.1. Algebraic methods based on constraint optimization	96
4.3.2.2. Algorithms	97
4.4. Statistical methods.	99
4.4.1. Case of overdetermination by the data	99
4.4.1.1. Bayesian statistical methods	99
4.4.1.2. Regularization.	100
4.4.1.3. Markov fields and Gibbs distributions	100
4.4.1.4. Potential function	102
4.4.1.5. Choice of hyperparameters	103
4.4.2. MAP reconstruction algorithms	105
4.4.2.1. ML-EM algorithm	105
4.4.2.2. MAP-EM algorithm	105
4.4.2.3. Semi-quadratic regularization	106
4.4.2.4. Regularization algorithm ARTUR	106
4.4.2.5. Regularization algorithm MOISE	107
4.4.3. Case of underdetermination by the data.	107
4.4.3.1. MEM method	107
4.4.3.2. <i>A priori</i> distributions.	109
4.5. Example of tomographic reconstruction	110
4.6. Discussion and conclusion	110
4.7. Bibliography	112

PART 2. MICROTOMOGRAPHY	117
Chapter 5. Tomographic Microscopy	119
Yves USSON and Catherine SOUCHIER	
5.1. Introduction.	119
5.2. Projection tomography in electron microscopy.	120
5.3. Tomography by optical sectioning	121
5.3.1. Confocal laser scanning microscopy (CLSM).	122
5.3.1.1. Principle of confocal microscopy	122
5.3.1.2. Image formation	123
5.3.1.3. Optical sectioning.	126
5.3.1.4. Fluorochromes employed in confocal microscopy	128
5.4. 3D data processing, reconstruction and analysis	129
5.4.1. Fluorograms	129
5.4.2. Restoration.	130
5.4.2.1. Denoising	130
5.4.2.2. Absorption compensation	132
5.4.2.3. Numerical deconvolution	132
5.4.3. Microscopy by multiphoton absorption	135
5.5. Bibliography	138
Chapter 6. Optical Tomography	141
Christian DEPEURSINGE	
6.1. Introduction.	141
6.2. Interaction of light with matter	142
6.2.1. Absorption	143
6.2.2. Fluorescence.	145
6.2.3. Scattering.	146
6.2.3.1. Inelastic scattering	146
6.2.3.2. Elastic scattering	146
6.3. Propagation of photons in diffuse media.	150
6.3.1. Coherent propagation	151
6.3.2. Mixed coherent/incoherent propagation.	156
6.3.3. Incoherent propagation	157
6.3.4. Radiative transfer theory.	158
6.4. Optical tomography methods	164
6.4.1. Optical coherence tomography	166
6.4.1.1. Diffraction tomography	166
6.4.1.2. Born approximation	169
6.4.1.3. Principle of the reconstruction of the object in diffraction tomography	170
6.4.1.4. Data acquisition.	174

6.4.1.5. Optical coherence tomography	176
6.4.1.6. Role of the coherence length	177
6.4.1.7. The principle of coherent detection	178
6.4.1.8. Lateral scanning.	178
6.4.1.9. Coherence tomography in the temporal domain	180
6.4.1.10. Coherence tomography in the spectral domain	181
6.5. Optical tomography in highly diffuse media	181
6.5.1. Direct model, inverse model	182
6.5.2. Direct model.	184
6.5.2.1. Fluence	184
6.5.2.2. Radiance	184
6.5.3. Inverse model	185
6.5.4. Iterative methods	186
6.5.5. Perturbation method	186
6.5.6. Reconstruction by inverse projection	187
6.5.7. Temporal domain	187
6.5.8. Frequency domain	189
6.6. Bibliography	190
Chapter 7. Synchrotron Tomography.	197
Anne-Marie CHARVET and Françoise PEYRIN	
7.1. Introduction.	197
7.2. Synchrotron radiation	197
7.2.1. Physical principles	197
7.2.2. Advantages of synchrotron radiation for tomography	201
7.3. Quantitative tomography	202
7.3.1. State of the art	202
7.3.2. ESRF system and applications.	204
7.4. Microtomography using synchrotron radiation	206
7.4.1. State of the art	206
7.4.2. ESRF system and applications.	207
7.5. Extensions	210
7.5.1. Phase contrast and holographic tomography	210
7.5.2. Tomography by refraction, diffraction, diffusion and fluorescence	211
7.6. Conclusion	211
7.7. Bibliography	212
PART 3. INDUSTRIAL TOMOGRAPHY	215
Chapter 8. X-ray Tomography in Industrial Non-destructive Testing . . .	217
Gilles PEIX, Philippe DUVAUCHELLE and Jean-Michel LETANG	
8.1. Introduction.	217

8.2. Physics of the measurement	218
8.3. Sources of radiation	219
8.4. Detection	220
8.5. Reconstruction algorithms and artifacts	223
8.5.1. Analytical methods	223
8.5.2. Algebraic methods	223
8.5.3. Reconstruction artifacts	223
8.6. Applications	224
8.6.1. Tomodensitometry	224
8.6.2. Expert's report	225
8.6.3. High-energy tomography	225
8.6.4. CAD models in tomography: reverse engineering and simulation	226
8.6.4.1. Reverse engineering	227
8.6.4.2. Simulation	227
8.6.5. Microtomography	228
8.6.6. Process tomography	230
8.6.7. Dual-energy tomography	230
8.6.8. Tomosynthesis	232
8.6.9. Scattering tomography	233
8.7. Conclusion	235
8.8. Bibliography	236
Chapter 9. Industrial Applications of Emission Tomography for Flow Visualization	239
Samuel LEGOUPIL and Ghislain PASCAL	
9.1. Industrial applications of emission tomography	239
9.1.1. Context and objectives	239
9.1.2. Non-nuclear techniques	240
9.1.3. Nuclear techniques	240
9.2. Examples of applications	242
9.2.1. Two-dimensional flow	242
9.2.2. Flow in a pipe – analysis of a junction	244
9.3. Physical model of data acquisition	247
9.3.1. Photon transport	247
9.3.2. Principle of the Monte Carlo simulation	248
9.3.3. Calculation of projection matrices	249
9.3.3.1. Estimation of projection profiles	249
9.3.3.2. Estimation of the projection matrix	251
9.4. Definition and characterization of a system	252
9.4.1. Characteristic system parameters	252
9.4.2. Characterization of images reconstructed with the EM algorithm	254
9.4.2.1. Underdetermined systems	254

9.5. Conclusion	255
9.6. Bibliography	255
PART 4. MORPHOLOGICAL MEDICAL TOMOGRAPHY	257
Chapter 10. Computed Tomography	259
Jean-Louis AMANS and Gilbert FERRETTI	
10.1. Introduction	259
10.1.1. Definition	259
10.1.2. Evolution of CT	260
10.1.3. Scanners with continuous rotation	261
10.1.4. Multislice scanners	263
10.1.5. Medical applications of CT	264
10.2. Physics of helical tomography	265
10.2.1. Projection acquisition system	265
10.2.1.1. Mechanics for continuous rotation	266
10.2.1.2. X-ray tubes with large thermal capacity	266
10.2.1.3. X-ray detectors with high dynamics, efficiency, and speed	266
10.2.1.4. Helical acquisitions	267
10.2.2. Reconstruction algorithms	267
10.2.2.1. Hypotheses	267
10.2.2.2. Interpolation algorithms	268
10.2.2.3. Slice spacing	269
10.2.3. Image quality	270
10.2.3.1. Axial spatial resolution	270
10.2.3.2. Longitudinal spatial resolution	270
10.2.3.3. Image noise	270
10.2.3.4. Artifacts	271
10.2.4. Dose	271
10.3. Applications of volume CT.	272
10.3.1. Role of visualization of axial slices	272
10.3.2. Role of 2D and 3D postprocessing	272
10.3.3. Abdominal applications	272
10.3.4. Thoracic applications	273
10.3.5. Vascular applications	276
10.3.6. Cardiac applications	277
10.3.7. Polytrauma	279
10.3.8. Pediatric applications	279
10.4. Conclusion	279
10.5. Bibliography	280

Chapter 11. Interventional X-ray Volume Tomography	287
Michael GRASS, Régis GUILLEMAUD and Volker RASCHE	
11.1. Introduction	287
11.1.1. Definition.	287
11.1.2. Acquisition systems.	288
11.1.3. Positioning with respect to computed tomography	289
11.2. Example of 3D angiography	290
11.2.1. Principles of projection acquisition	291
11.2.2. Data processing	291
11.2.2.1. Calibration	291
11.2.2.2. Reconstruction algorithm	295
11.2.3. Other reconstruction methods in 3D radiology.	296
11.2.4. Visualization	297
11.3. Clinical examples	297
11.3.1. High contrast applications	298
11.3.2. Soft tissue contrast applications.	299
11.3.3. Cardiac applications	300
11.4. Conclusion	302
11.5. Bibliography	303
Chapter 12. Magnetic Resonance Imaging.	307
André BRIGUET and Didier REVEL	
12.1. Introduction	307
12.2. Nuclear paramagnetism and its measurement	308
12.2.1. Nuclear magnetization	308
12.2.2. Nuclear magnetic relaxation and Larmor precession	308
12.2.3. NMR signal formation	309
12.2.4. Instrumentation	311
12.3. Spatial encoding of the signal and image reconstruction	312
12.3.1. Information content of the signal's phase	312
12.3.2. Signal sampling along k-space trajectories and use of a 2D model	314
12.3.2.1. Cartesian k-space sampling	314
12.3.2.2. Non-Cartesian k-space sampling	316
12.4. Contrast factors and examples of applications	318
12.4.1. Density of nuclei and magnetization	318
12.4.2. Relaxation times and discrimination between soft tissues	318
12.4.3. Contrast agents in MRI.	320
12.4.4. Relevance of magnetization transfer techniques	320
12.4.5. Flow of matter	321
12.4.6. Diffusion and perfusion effects	322
12.5. Tomography or volumetry?	323
12.6. Bibliography	323

PART 5. FUNCTIONAL MEDICAL TOMOGRAPHY	327
Chapter 13. Single Photon Emission Computed Tomography	329
Irène BUVAT, Jacques DARCOURT and Philippe FRANKEN	
13.1. Introduction	329
13.1.1. Definition	329
13.1.2. Functional versus anatomical imaging.	329
13.2. Radiopharmaceuticals	330
13.2.1. Vectors	330
13.2.2. Radioactive gamma markers	331
13.3. Detector	331
13.3.1. General principle of the gamma camera.	331
13.3.2. Special features of single photon detection: collimator and spectrometry.	332
13.3.3. Principle characteristics of the gamma camera.	333
13.3.4. Principle of projection acquisition	334
13.3.5. Transmission measurement system.	335
13.4. Image reconstruction	336
13.4.1. Hypotheses	336
13.4.2. Reconstruction algorithms	337
13.4.2.1. Tomographic reconstruction problem in SPECT.	337
13.4.2.2. Analytical reconstruction in SPECT	338
13.4.2.3. Algebraic reconstruction in SPECT	338
13.4.3. Specific problems of single photon detection.	339
13.4.3.1. Counting noise.	340
13.4.3.2. Attenuation	340
13.4.3.3. Scatter	341
13.4.3.4. Variation of the spatial resolution with depth	342
13.5. Example of myocardial SPECT	343
13.5.1. Indications	343
13.5.2. Radiopharmaceuticals, injection and acquisition protocols	344
13.5.3. Reconstruction and interpretation criteria	344
13.5.4. Importance of the accuracy of the projection model.	345
13.5.5. Examples	346
13.6. Conclusion	346
13.7. Bibliography	348
Chapter 14. Positron Emission Tomography	351
Michel DEFRISE and Régine TRÉBOSSEN	
14.1. Introduction	351
14.1.1. Definition.	351
14.1.2. PET versus other functional imaging techniques.	351

14.1.3. Functional versus anatomical imaging	353
14.2. Data acquisition	353
14.2.1. Radiopharmaceuticals	353
14.2.1.1. Vectors	353
14.2.1.2. Positron emitting markers	354
14.2.2. Physical principle of PET	354
14.2.2.1. Positron annihilation	354
14.2.2.2. Principle of coincidence detection	355
14.2.2.3. Type of detected coincidences	355
14.2.3. Detection systems employed in PET	356
14.2.3.1. Detectors	356
14.2.3.2. Detector arrangement	357
14.2.4. Physical characteristics of scanners	358
14.2.5. Acquisition modes	358
14.2.5.1. Two-dimensional (2D) acquisition	358
14.2.5.2. Three-dimensional (3D) acquisition	360
14.2.5.3. 3D data organization for a multiline scanner	361
14.2.5.4. LOR and list mode acquisition	361
14.2.5.5. Acquisition with time-of-flight measurement	362
14.2.5.6. Transmission scan acquisition	362
14.3. Data processing	363
14.3.1. Data correction	364
14.3.2. Reconstruction of corrected data	365
14.3.3. Dynamic studies	366
14.3.3.1. Measurement of glucose metabolism	367
14.3.3.2. Model	368
14.3.3.3. Acquisition protocol	369
14.4. Research and clinical applications of PET	370
14.4.1. Clinical applications of PET: whole-body measurements of glucose metabolism in oncology	370
14.4.1.1. Physiological basis	370
14.4.1.2. Acquisition and reconstruction protocol	370
14.4.1.3. Image interpretation: sensitivity and specificity of this medical imaging modality	371
14.4.2. Clinical research applications: study of dopaminergic transmission	372
14.4.2.1. Dopaminergic transmission system	372
14.4.2.2. Dopamine synthesis	372
14.4.2.3. Tracers	372
14.4.2.4. Example of use: study of neurodegenerative diseases that affect the basal ganglia	373
14.5. Conclusion	373
14.6. Bibliography	374

Chapter 15. Functional Magnetic Resonance Imaging	377
Christoph SEGBARTH and Michel DÉCORPS	
15.1. Introduction	377
15.2. Functional MRI of cerebrovascular responses.	378
15.3. fMRI of BOLD contrasts	380
15.3.1. Biophysical model	380
15.3.2. “Static” conditions	381
15.3.3. “Intermediate” conditions	382
15.3.4. “Motional narrowing” conditions.	382
15.3.5. In practice	383
15.4. Different protocols	383
15.4.1. Block paradigms.	384
15.4.2. Event-related paradigms	384
15.4.3. Fourier paradigms.	387
15.5. Bibliography	389
Chapter 16. Tomography of Electrical Cerebral Activity in Magneto- and Electro-encephalography.	393
Line Garnero	
16.1. Introduction	393
16.2. Principles of MEG and EEG	394
16.2.1. Sources of MEG and EEG	394
16.2.2. Evolution of EEG	395
16.2.3. MEG instrumentation.	395
16.2.4. Applications	397
16.3. Imaging of electrical activity of the brain based on MEG and EEG signals	398
16.3.1. Difficulties of reconstruction	398
16.3.2. Direct problem and different field calculation methods.	399
16.3.3. Inverse problem	402
16.3.3.1. Parametric or “dipolar” methods	403
16.3.3.2. Tomographic or “distributed” methods	405
16.4. Conclusion	407
16.5. Bibliography	408
List of Authors	411
Index	417
