PREFACE	ix
NOTATIONS AND SYMBOLS	xiii
CHAPTER 1. PURE CRYSTALLINE SOLIDS	1
1.1. Characteristic values of a solid	1
1.2. Effect of stress and Young's modulus	2
1.3. Microscopic description of crystalline solids	4
1.4. Partition function of vibration of a solid	5
1.4.1. Einstein's single-frequency model	5
1.4.2. Debye's frequency distribution model	6
1.4.3. Models with more complex frequency distributions	9
1.5. Description of atomic solids	10
1.5.1. Canonical partition function of an atomic solid.	10
1.5.2. Helmholtz energy and internal energy of an atomic solid.	11
1.6. Description of molecular solids	13
1.6.1. Partition function of molecular crystals	13
1.6.2. Thermodynamic functions of molecular solids	14
1.7. Description of an ionic solid	15
1.7.1. Crosslink energy of an ionic solid.	15
1.7.2. Born/Haber cycle	22
1.7.3. Vibrational partition function and internal energy of an ionic solid.	23
1.8. Description of a metallic solid	26

1.8.1. Sommerfeld's electron perfect gas model	27
1.8.2. The metallic bond and band theory	37
1.9. Molar specific heat capacities of crystalline solids.	46
1.9.1. Contribution of the vibrational energy to the specific heat capacity at constant volume	46
1.9.2. Specific heat capacity of an atomic solid at constant volume.	50
1.9.3. Specific heat capacity of a molecular- or ionic-solid at constant volume	54
1.9.4. Conclusion as to the specific heat capacity of a crystalline solid.	54
1.10. Thermal expansion of solids	55
1.10.1. Expansion coefficients	55
1.10.2. Origin of thermal expansion in solids	58
1.10.3. Quantum treatment of thermal expansion. Grüneisen parameter	62
1.10.4. Expansion coefficient of metals.	68
CHAPTER 2. SOLID SOLUTIONS	71
2.1. Families of solid solutions	71
2.1.1. Substitutional solid solutions	72
2.1.2. Insertion solid solution.	75
2.2. Order in solid solutions.	82
2.2.1. Short-distance order	83
2.2.2. Long-distance order	87
2.3. Thermodynamic models of solid solutions	94
2.3.1. Determination of the Gibbs energy of mixing	94
2.3.2. The microscopic model of the perfect solution.	100
2.3.3. Microscopic model of strictly-regular solutions	102
2.3.4. Microscopic model of the ideal dilute solution.	104
2.3.5. Fowler and Guggenheim's quasi-chemical model of the solution.	106
2.4. Thermodynamic study of the degree of order of an alloy	111
2.4.1. Hypotheses of the model: configuration energy	112
2.4.2. Expression of the configuration partition function	113
2.4.3. The Gorsky, Bragg and Williams model	114
2.4.4. The quasi-chemical model.	120
2.4.5. Comparison of the models against experimental results	127

2.5. Determination of the activity of a component of a solid solution	132
2.5.1. Methods common to solid solutions and liquid solutions	134
2.5.2. Methods specific to solid solutions	140
CHAPTER 3. NON-STOICHIOMETRY IN SOLIDS	147
3.1. Structure elements of a solid	147
3.1.1. Definition	148
3.1.2. Symbolic representation of structure elements	149
3.1.3. Building unit of a solid	151
3.1.4. Description and composition of a solid.	151
3.2. Quasi-chemical reactions in solids	153
3.2.1. Definition and characteristics of a quasi-chemical reaction between structure elements.	153
3.2.2. Homogeneous quasi-chemical reactions in the solid phase	156
3.2.3. Inter-phase reactions.	158
3.3. Equilibrium states between structure elements in solids	158
3.4. Thermodynamics of structure elements in unary solids	159
3.4.1. Structure elements of a unary solid	159
3.4.2. Global equilibrium of an isolated crystal – influence of temperature	162
3.5. Thermodynamics of structure elements in stoichiometric binary solids	165
3.5.1. Symmetrical disorders in stoichiometric binary solids	166
3.5.2. Asymmetrical disorders in stoichiometric binary solids	167
3.6. Thermodynamics of structure elements in non-stoichiometric binary solids.	169
3.6.1. Deviations from stoichiometry and point defects.	169
3.6.2. The predominant defect method – the Wagner classification	171
3.6.3. Equilibrium of a Wagner solid with one of its gaseous elements	174
3.6.4. General equilibrium of a non-stoichiometric binary solid with one of its gaseous elements.	175

3.7. Representation of complex solids – example of metal oxy-hydroxides	180
3.7.1. The pseudo-binary approximation	180
3.7.2. The predominant-defect generalization	180
3.8. Determination of the equilibrium constants of the reactions involving structure elements	181
3.8.1. Recap on calculating the equilibrium constants using statistical thermodynamics	182
3.8.2. Examination of the pre-exponential term in the quasi-chemical equilibrium constants	184
3.8.3. Determination of the internal energy of transformation of quasi-chemical reactions	187
CHAPTER 4. SOLID SOLUTIONS AND STRUCTURE ELEMENTS	195
4.1. Ionic solid solutions	195
4.1.1. Introduction of foreign elements into stoichiometric binary solids	197
4.1.2. Influence of foreign elements introduced into a non-stoichiometric binary solid	200
4.2. Thermodynamics of equilibria between water vapor and saline hydrates: non-stoichiometric hydrates	204
4.2.1. Experimental demonstration of non-stoichiometry of a hydrate	204
4.2.2. Equilibria between stoichiometric hydrates	207
4.2.3. Equilibrium reactions in non-stoichiometric hydrates	207
4.2.4. The limits of the domains of divariance	213
APPENDICES	217
APPENDIX 1. THE LAGRANGE MULTIPLIER METHOD	219
APPENDIX 2. SOLVING SCHRÖDINGER'S EQUATION	223
BIBLIOGRAPHY	227
INDEX	231
