Preface	ix
Chapter 1. Introduction to Lifetime Data and Regression Models	1
1.1. Basics	1
1.2. The classic lifetime distribution: the Weibull distribution	5
1.3. Regression models for lifetimes	9
1.4. Proportional hazards models	10
1.5. Checking the proportional hazards assumption	13
1.6. Accelerated failure time models	17
1.7. Checking the accelerated failure time assumption	20
1.8. Proportional odds models	22
1.9. Proportional mean residual life models	25
1.10. Proportional reversed hazard rate models	26
1.11. The accelerated hazards model	27
1.12. The additive hazards model	29
1.13. PH, AFT and PO distributions	30
1.14. Cox's semi-parametric PH regression model	33
1.15. PH versus AFT	35
1.16. Residuals	39
1.17. Cured fraction or long-term survivors	43
1.18. Frailty	45

1.19. Models for discrete lifetime data	47
1.20. Conclusions	52
Chapter 2. First Hitting Time Regression Models	55
2.1. Introduction	55
2.2. First hitting time models	58
2.3. First hitting time regression models based on an underlying Wiener process	60
2.4. Long-term survivors	63
2.5. FHT versus PH	65
2.6. Randomized drift in the Wiener process	69
2.7. First hitting time regression models based on an underlying Ornstein-Uhlenbeck process	71
2.8. The Birnbaum-Saunders distribution	74
2.9. Gamma processes	75
2.10. The inverse Gaussian process	77
2.11. Degradation and markers	77
Chapter 3. Model Fitting and Diagnostics	81
3.1. Introduction	81
3.2. Fitting the FHT regression model by maximum likelihood	82
3.3. The <i>stthreg</i> package	84
3.4. The <i>threg</i> package	86
3.5. The <i>invGauss</i> package	86
3.6. Fitting FHT regressions using the EM algorithm	87
3.7. Bayesian methods	88
3.8. Checking model fit	89
3.9. Issues in fitting inverse Gaussian FHT regression models	90
3.9.1. Possible collinearity?	90
3.9.2. Fitting inverse Gaussian FHT regression: a simulation study	92
3.9.3. Fitting the wrong model	95
3.10. Influence diagnostics for an inverse Gaussian FHT regression model	97
3.11. Variable selection	99

Chapter 4. Extensions to Inverse Gaussian First Hitting Time Regression Models	103
4.1. Introduction	103
4.2. Time-varying covariates	103
4.3. Recurrent events	106
4.4. Individual random effects	107
4.5. First hitting time regression model for recurrent events with random effects	110
4.6. Multiple outcomes	116
4.7. Extensions of the basic FHT model in a study of low birth weights: a mixture model and a competing risks model	119
4.7.1. Mixture model	120
4.7.2. Competing risks model	121
4.7.3. Comparative results	122
4.8. Semi-parametric modeling of covariate effects	123
4.9. Semi-parametric model for data with a cured fraction	125
4.10. Semi-parametric time-varying coefficients	126
4.11. Bivariate Wiener processes for markers and outcome	128
Chapter 5. Relationship of First Hitting Time Models to Proportional Hazards and Accelerated Failure Time Models	131
5.1. Introduction	131
5.2. FHT and PH models: direct comparisons by case studies	131
5.2.1. Case study 1: mortality after cardiac surgery	131
5.2.2. Case study 2: lung cancer in a cohort of nurses	134
5.3. FHT and PH models: theoretical connections	134
5.3.1. Varying the time scale	135
5.3.2. Varying the boundary	137
5.3.3. Estimation	137
5.4. FHT and AFT models: theoretical connections	138

Chapter 6. Applications	141
6.1. Introduction	141
6.2. Lung cancer risk in railroad workers	143
6.3. Lung cancer risk in railroad workers: a case-control study	144
6.4. Occupational exposure to asbestos	147
6.5. Return to work after limb injury	147
6.6. An FHT mixture model for a randomized clinical trial with switching	148
6.7. Recurrent exacerbations in COPD	150
6.7.1. COPD in lung cancer	153
6.8. Normalcy and discrepancy indexes for birth weight and gestational age	153
6.9. Hip fractures	155
6.10. Annual risk of death in cystic fibrosis	158
6.11. Disease resistance in cows	159
6.12. Balka, Desmond and McNicholas: an application of their cure rate models	161
6.13. Progression of cervical dilation	163
Bibliography	165
Index	181
