Note to the Reader	xvii
List of Acronyms	xxi
Introduction	xxvii
Part 1. Sustainability: Toward the Unification of Some Underlying Principles and Mechanisms	1
Chapter 1. Toward a Sustainability Science	3
1.1. Introduction.	3
1.2. What does unification mean?	4
1.3. Coming back to sustainability: how many “sustainabilities”?	7
1.4. Sustainability: what kind of unification? An integration issue?	10
1.5. What kind of paradigm do we have to integrate?	12
1.6. The issue and the implementation of a new dimension	14
1.6.1. Preamble: code of matter, power of laws and balance of powers	14
1.6.2. The addition of a new dimension: gimmick or necessity?	16
1.6.3. Integration of time and dynamics	17
1.6.4. Application	19
1.7. Extensions of the concept	20
1.7.1. Comments	20

1.7.2. Life sciences: power laws, evolution, life and death phenomena	21
1.7.3. The power laws	24
Chapter 2. Sustainability in Complex Systems	29
2.1. Preamble: theories of interconnected systems	29
2.2. Analysis of feedback phenomena in an assembly manufacturing cell	30
2.2.1. Preliminary considerations	30
2.2.2. Case study 1: modeling the limitation of work in progress (WIP) by a threshold called “MAQ”.	32
2.2.3. Case study 2: modeling the WIP through assignment rules	33
2.2.4. Case study 3: model building based on dynamic management of bottlenecks	34
2.2.5. Main comments	36
2.3. Application to complex systems: quantitative characteristics of a deterministic chaos	37
2.3.1. Introduction	37
2.3.2. Quantification of state variables in a production system.	39
2.4. General considerations about interactions in networked organizations	39
2.5. Role of feedback in mimicry and ascendancy over others	41
2.6. Network theory: additional characteristics due to their new structure	43
2.6.1. Mycorrhization networks	46
2.7. Simplexification	47
2.8. Convergences in network theory	51
Chapter 3. Extension: From Complexity to the Code of Thought	53
3.1. The code of thought: effects of cognition and psyche in global sustainability	53
3.2. Is sustainability the only technological and technocratic approach?.	56
3.3. The three laws of sustainability: prediction and anticipation in complex systems.	57
3.3.1. Is sustainability a consistent property of any complex system?.	58
3.3.2. Sustainability is also the art of combining paradoxes.	59

3.3.3. Adaptation of a manufacturing process: what is so important in planning and scheduling?	59
3.3.4. Predicting the future? Is it a necessity?	60
3.4. Consequence: toward a new dimension	63
3.5. Conclusion	64
3.6. Indicators for monitoring the EU sustainable development strategy	65
Part 2. Operationalization: Methods, Techniques and Tools – the Need to Manage the Impact.	69
Chapter 4. From Context to Knowledge: Building Decision-making Systems	71
4.1. Introduction.	71
4.1.1. In the back part of the brain, there is the cerebellum	72
4.1.2. In the temporal lobe of the cerebrum and limbic system	73
4.1.3. The frontal lobe of the cerebrum (frontal neocortex)	73
4.2. How about obtaining a sustainable knowledge?	74
4.2.1. The first question: how do we learn from experience?	74
4.2.2. The second question: how do we learn from experiences and develop a conceptual understanding?	75
4.2.3. The third question: how do we model a sustainable information and knowledge processing system?	76
4.3. Preliminary consideration: the nature of the problems encountered in test and diagnosis	77
4.3.1. The world of industry	78
4.3.2. Health and medical care	78
4.3.3. Consequences	80
4.4. Preamble: basic concepts for creating knowledge	80
4.4.1. Description of the basic reasoning techniques	80
4.4.2. Conventional collaborative techniques for creating knowledge	81
4.5. Retroduction and abduction	83
4.5.1. The retroduction technique	84
4.5.2. The abduction technique.	86
4.6. Deduction and induction	87
4.6.1. The inductive reasoning technique.	88

4.6.2. Linear characteristics and limitations of induction and deduction	89
4.7. The development of a relational reasoning graph	90
4.8. A complete integrated reasoning process	92
4.9. How can a computer analyze different types of reasoning?	94
4.9.1. Theorem proving by semantic techniques	95
4.9.2. Theorem proving by syntactical techniques	95
4.9.3. Theorem proving by grammatical techniques	96
4.10. Applications.	96
4.10.1. Building the planning and scheduling involved in an industrial production system.	97
4.10.2. Diagnosis or classification in qualitative processes (medical, system testing, etc.)	97
4.10.3. Comments	98
Chapter 5. From Context to Knowledge: Basic Methodology Review	101
5.1. Application of abduction and retroduction to create knowledge	101
5.2. Analysis and synthesis as modeling process	102
5.2.1. Fundamental analytic process.	102
5.2.2 Modeling process	103
5.2.3. Abnormal or paranormal analysis and synthesis.	106
5.2.4. Application: the main influences due to basic emotions	107
5.2.5. Comment.	108
5.3. Background on empirical results: integration principles	109
5.3.1. Cyclical and hierarchical theories about theorizing; Heron and Kolb.	109
5.3.2. Complementary advice: how to get good knowledge?.	111
5.4. A review and comparison of some common approaches: TRIZ and C-K theory.	112
5.4.1. TRIZ is about design problem solving	112
5.4.2. C-K is dealing with design innovation	113
5.4.3. C-K INVENT: toward a methodology for transformational K	114
Chapter 6. From Knowledge to Context and Back: The C-K Theory and Methodology.	117
6.1. Introduction.	117
6.2. A primer on C-K theory	118
6.3. On the nature of the knowledge space	120

6.4. On the nature of the concept space	120
6.5. Discussing the theory	122
6.6. Some differentiating points and benefits of C-K theory	123
6.7. On fielding C-K theory in organizations	124
6.8. A summary on C-K theory	124
6.9. A short glossary on C-K theory	126
6.10. Links with knowledge management	128
6.11. Example on a specific futuristic conceptual case: “a man who can travel through time”	130
6.12. Methodological findings	130

**Part 3. Reformulating the Above Into
Business Models and Solutions for
New Growth and Applications 135**

**Chapter 7. Principles and Methods for the
Design and Development of Sustainable Systems 137**

7.1. Introduction	137
7.2. How to go further?	139
7.3. Examples of methods and learning related to complex adaptive systems	140
7.3.1. Why and how to mix different theories?	141
7.3.2. Errors and mistakes not to make	142
7.4. First example: crisis management	143
7.5. Second example: urban organizations	144
7.5.1. A village infrastructure	144
7.5.2. Urban networks	146
7.6. Third example: education and career evolution	148
7.7. A review of survival, resilience and sustainability concepts	149
7.7.1. Definition of resilience	150
7.7.2. Definition of sustainability	151
7.7.3. Definition of reliability	153
7.7.4. Structure and organization of the concepts	154
7.8. Methodologies in sustainability	155
7.8.1. Modeling a sustainable system	156
7.8.2. Evaluation of the sustainability	157
7.8.3. Causes of non-achieving sustainability	158
7.9. Resilience: methodology	162
7.9.1. Problem of attitude change	162
7.9.2. Solving approaches	164
7.9.3. Methods associated with structured scenarios	165

7.9.4. Adaptive management in the Everglades and the Grand Canyon	166
7.9.5. Living together and empathy	167
7.10. Information system sustainability	171
7.10.1. General approach to assess reliability and sustainability in a complex system	171
7.10.2. Favoring a step-by-step approach.	172
7.10.3. Comments about sustainability assessment	173
7.11. Application: managing the “skill mismatch” in a company.	177
7.11.1. Assumptions	177
7.11.2. Methodological approach	178
7.11.3. Model development and results	180
7.12. Sustainability of the organizations in a company	181
7.13. Conclusions	183
Chapter 8. Toward the Mass Co-design: Why is Social Innovation so Attractive?	189
8.1. Introduction.	189
8.2. How can we define innovation and social innovation?	190
8.2.1. Innovation: main principles	190
8.2.2. Social innovation: an evolution.	191
8.3. Sustainability: how can we position social innovation?	193
8.4. Social innovation examples	195
8.4.1. Application 1: research and development of future technologies	195
8.4.2. Application 2: marketing and sales: “I think to you”	197
8.4.3. Application 3: inclusivity and cognition	200
8.4.4. Consequences	201
8.5. A contextual change in society	203
8.5.1. Networks are everywhere	203
8.5.2. Advantages of the Web approach	203
8.6. Basic concepts and mechanisms	205
8.6.1. The social concept of a process: principle of emergence	206
8.6.2. The social innovation process mechanism	207
8.6.3. Social innovation: conditions for sustainable implementation.	209
8.7. The principle of circularity: a paradigm shift	211
8.8. Generalization: how to turn back time	212
8.9. Problems of technological evolution	214

8.9.1. In nature, evolution is consistent with Moore's law.	214
8.9.2. The limits of new technologies and sciences.	215
8.9.3. Application in industry: where are we going?	216
8.10. Evolution: application to cellular networks	218
8.10.1. Extended environments	218
8.10.2. Social networking	219
8.11. Conclusions: the new sustainable environment	220
8.11.1. Generalities.	220
8.11.2. Global process engineering	221
8.11.3. Intelligence economy.	222
Chapter 9. On Integrating Innovation and CSR when Developing Sustainable Systems	225
9.1. The new Smartphones: a tool for an inclusive society.	225
9.2. Innovation and corporate social responsibility (CSR) behaviors	228
9.3. Integrating business objectives (CBO) and corporate social responsibility (SCR)	230
9.3.1. Implementation comments	230
9.4. Lessons gained from this study case: toward a citizen democracy	234
9.5. Conclusion on crowd and social approaches	238
Part 4. Reformulating Future Thinking: Processes and Applications	239
Chapter 10. Sustainability Engineering and Holism: Thinking Conditions are a Must	241
10.1. Introduction to holism.	241
10.1.1. What do we mean by holism?.	242
10.1.2. Application to decision and management systems.	243
10.2. Toward a holistic company.	244
10.3. Culture: on what positive factors can we rely?	246
10.4. Sustainability: a framework	249
10.5. Application: holonic industrial systems	250
10.5.1. Definitions	250
10.5.2. The design of a holonic manufacturing system (HMS)	251
10.5.3. Holism: a contribution to a better sustainability	253
10.6. Consequences.	254
Chapter 11. Sustainable Cognitive Engineering: Brain Modeling; Evolution of a Knowledge Base	257
11.1. Introduction	257
11.2. Sustainable cognition: definition and concepts	258

11.3. Concepts and “slippage” needs: effects related to new generations	260
11.4. Basic structure of our brain: a probabilistic approach	261
11.4.1. Application to a human population: macro behavior and conditional probabilities	262
11.4.2. Bayes theorem: a universal statistical concept	264
11.4.3. Impact of the Bayes theorem on information system sustainability and decision theory	265
11.5. Application and probabilistic reasoning in updating a knowledge base: a more sustainable model.	266
11.5.1. Two applications	266
11.5.2. Complex reasoning: a question of plausibility and probabilistic estimates	269
11.6. Sustainable cognition: brain structure, understanding micro-to-macro links	271
11.7. More recent developments	271
11.8. Detection of novelties through adaptive learning and fractal chaos approaches	274
11.9. Neuro computing: new opportunities provided by quantum physics.	277
11.10. Applications	279
11.11. Quantum physics: impact on future organizations	280
Chapter 12. Brain and Cognitive Computing: Where Are We Headed?	283
12.1. State of the art	283
12.2. Achievements: is neuroscience able to explain how to perform sustained assumptions and studies?.	284
12.3. Artificial brain: evolution of the simulation models	289
12.4. Examples of challenges to be well controlled	290
Part 5. Towards an Approach to the Measurement of Sustainability and Competitiveness	293
Chapter 13. On Measuring Sustainability	295
13.1. Introduction	295
13.2. Some basic criteria specific to the new “Sustainable” era	296
13.3. What are the nature and limits of the new paradigm, in terms of sustainability evolution?.	297
13.4. A reminder about competitiveness and sustainability properties	299

13.5. Synthesis: the present dimensions of a production system.	302
13.6. An under-assessed value: time.	305
13.7. Application and results	307
13.7.1. Time is the source of streams and flows.	307
13.7.2. Time and power: some considerations about streams and throughputs.	308
13.7.3. Measurement of sustainability in a chaotic system: Lyapunov experiments.	310
13.7.4. Consequences at governance level to get a sustainable system.	312
13.8. Two new dimensions: thought and information within network theory.	313
13.8.1. From storytelling.	314
13.8.2. . . . to “talking bullshit”	315
13.8.3. An improved understanding of a “New World” complexity.	315
13.9. Synthesis: cognitive advances provided by the new exchange and communication tools	316
13.9.1. The cognitive behaviors associated with this classification.	317
13.9.2. Synthesizing the cognitive advances.	319
13.10. Consequences and characteristics linked to a global network notion.	321
13.10.1. Generalizing the knowledge at organization level.	321
13.10.2. The behaviors associated with human beings’ psychological features	322
13.11. Back to the code of matter: contributions to “Simultaneous Time” and “Network Theory”	323
13.12. Application of quantum interactions	326
13.13. Sustainability: how to widen the scope of competitiveness indicators?	328
13.14. Conclusion.	330
13.15. Social interactions and massively multiplayer online role playing games	330
General Conclusion	333
Bibliography	355
Index	375
