Introduction	ix
Chapter 1. Observing and Preparing a Data Set	1
1.1. Creating a database in relation to our predetermined goals	1
1.2. Observing the database scrupulously	3
1.2.1. Missing data	3
1.2.2. The heterogeneity of the variables	4
1.2.3. Dealing with replicates.	5
1.2.4. The number of objects and descriptors	6
1.2.5. Managing double zeroes.	7
1.2.6. Goals/data sets compatibility	7
1.3. Reducing the number of environmental variables	9
1.3.1. Why is it relevant?	9
1.3.2. Escoufier's method: reducing variables while keeping the maximum amount of information.	9
1.3.3. Spearman's correlation matrix: understanding redundancies between variables	11
1.4. Eliminating rare species	13
1.4.1. Why is it relevant?	13
1.4.2. The median value method.	14
1.4.3. The abundance sorting method	15
Chapter 2. Preliminary Treatment of the Data Set	19
2.1. Abundances, species richness and species diversity	19
2.1.1. Total abundances	19
2.1.2. Species richness.	20
2.1.3. Diversity indices	22

2.2. Transformations	24
2.2.1. Quantitative data expressed with heterogeneous units (e.g. chemical physical data)	24
2.2.2. Quantitative data expressed with homogeneous units (e.g. flora and fauna)	26
2.2.3. Qualitative data (e.g. environmental factors)	29
2.2.4. Attempting to normalize data	30
2.3. Association measures and matrices	30
2.3.1. How to choose our measure?	30
2.3.2. Direct mode	32
2.3.3. Indirect mode	34
Chapter 3. Structure as Groups of Objects/Variables	35
3.1. The most used types of cluster analysis	35
3.1.1. How to choose a clustering algorithm?	36
3.1.2. Hierarchical clustering	37
3.1.3. k-Means non-hierarchical clustering	46
3.1.4. Fuzzy c-means clustering	48
3.2. Information on the descriptors that generate the groups obtained	49
3.2.1. Simple graphical representation	49
3.2.2. Analysis of variance	51
3.2.3. Determining indicator species	51
Chapter 4. Structure as Gradients of Objects/Variables	57
4.1. Parametric alternative: unconstrained ordination	57
4.1.1. Mathematical principle	59
4.1.2. Principal component analysis	61
4.1.3. Correspondence analysis	70
4.1.4. Multiple correspondence analysis	78
4.1.5. Principal coordinates analysis	83
4.2. Non-parametric alternative: nMDS	88
4.2.1. Mathematical principle	88
4.2.2. Direct mode	90
4.2.3. Indirect mode	92
Chapter 5. Understanding a Structure	95
5.1. Correlating a structure with one or more structures without causal hypothesis	96
5.1.1. Correlating groups	96
5.1.2. Correlating association matrices	98
5.1.3. Correlating different data tables	101

5.2. Explaining a structure	110
5.2.1. The structuring factors of groups	110
5.2.2. Quantitative factors that structure gradients	126
5.2.3. Qualitative factors that structure gradients	145
Conclusion	155
Bibliography	157
