Foreword	ix
Introduction, Context and Motivations	xi
Chapter 1. Energy Integration of Continuous Processes: From Pinch Analysis to Hybrid Exergy/Pinch Analysis	1
1.1. Pinch analysis	1
1.1.1. Basis of pinch analysis.	1
1.1.2. Building the heat cascade	2
1.1.3. Composite curves (CC) and grand composite curve (GCC).	6
1.1.4. Pinch rules	9
1.1.5. Utility targeting using the GCC	10
1.2. Exergy-based methodology for thermodynamic system systematic integration	12
1.2.1. Mathematical model	14
1.2.2. Case studies	23
1.3. Heat exchanger network synthesis	28
1.3.1. Mathematical model	30
1.3.2. Case study	39
1.4. Process modification guided by the pinch–exergy methodology	43
1.4.1. Process modification methodology	44
1.4.2. Case study: agro food industry concentrator study	45

Chapter 2. Variable and Batch Processes Energy Integration Techniques: Energy Storage Optimal Design and Integration	55
2.1. Why is energy integration of discontinuous processes (EIDP) important?	56
2.1.1. Definition of batch or discontinuous processes	56
2.1.2. Specifications of the EIDP	58
2.2. Heat exchange types in discontinuous processes	58
2.3. Heat storage types	58
2.3.1. Sensible heat storage	58
2.3.2. Latent heat storage	60
2.4. Different energy integration methods for discontinuous processes	60
2.4.1. Pinch analysis-based methods	61
2.5. Time average model.	61
2.6. Time slice model.	63
2.7. Rescheduling	64
2.8. Introducing heat storage	66
2.8.1. Exergy-based model for heat integration of variable processes designing heat storage tanks and heat conversion systems	68
2.9. Description of heat integration network	69
2.10. Inputs and outputs of the model	69
2.11. MILP formulation of the optimization problem.	70
2.12. Function to optimize.	75
2.13. Case studies	76
2.13.1. Molecular sieve regeneration process	76
2.13.2. Data extraction and TAM application	77
2.13.3. Heat storage tank design	79
2.14. The dairy cleaning processes.	85
2.14.1. Studied scenarios	87
Chapter 3. Exergy-based Methodology for Cycle Architecture and Working Fluid Selection: Application to Heat Pumps.	91
3.1. Methodology description.	92
3.2. Cycle architecture analysis.	93
3.3. Working fluid selection criteria	95

3.4. Mathematical optimization of cycle architecture and operating parameters	100
3.4.1. Fluid property implementation	101
3.4.2. Assumptions	102
3.4.3. Performance model	102
3.4.4. The subcooling parameter	103
3.5. Heat pump in a dairy process example	107
Conclusion	113
Bibliography	115
Index	119
