INTRODUCTION	ix
CHAPTER 1. MULTISENSOR DATA FUSION	1
1.1. Issues at stake.	1
1.2. Problems	4
1.2.1. Interpretation and modeling of data.	8
1.2.2. Reliability handling.	10
1.2.3. Knowledge propagation	11
1.2.4. Matching of ambiguous data.	12
1.2.5. Combination of sources	14
1.2.6. Decision-making.	16
1.3. Solutions	21
1.3.1. Panorama of useful theories	21
1.3.2. Process architectures.	24
1.4. Position of multisensor data fusion	27
1.4.1. Peculiarities of the problem	27
1.4.2. Applications of multisensor data fusion.	28
CHAPTER 2. REFERENCE FORMALISMS	31
2.1. Probabilities	31
2.2. Fuzzy sets.	35
2.3. Possibility theory.	39
2.4. Belief functions theory	43
2.4.1. Basic functions	44
2.4.2. A few particularly useful cases	47
2.4.3. Conditioning/deconditioning	49
2.4.4. Refinement/coarsening.	50

CHAPTER 3. SET MANAGEMENT AND INFORMATION PROPAGATION.	53
3.1. Fuzzy sets: propagation of imprecision.	53
3.2. Probabilities and possibilities: the same approach to uncertainty	56
3.3. Belief functions: an overarching vision in terms of propagation	57
3.3.1. A generic operator: extension	58
3.3.2. Elaboration of a mass function with minimum specificity.	61
3.3.3. Direct exploitation of the operator of extension	64
3.4. Example of application: updating of knowledge over time	66
CHAPTER 4. MANAGING THE RELIABILITY OF INFORMATION.	71
4.1. Possibilistic view	72
4.2. Discounting of belief functions	73
4.3. Integrated processing of reliability	75
4.4. Management of domains of validity of the sources	77
4.5. Application to fusion of pixels from multispectral images	82
4.6. Formulation for problems of estimation	87
CHAPTER 5. COMBINATION OF SOURCES	91
5.1. Probabilities: a turnkey solution, Bayesian inference	92
5.2. Fuzzy sets: a grasp of axiomatics	94
5.3. Possibility theory: a simple approach to the basic principles	102
5.4. Theory of belief functions: conventional approaches	106
5.5. General approach to combination: any sets and logics	113
5.6. Conflict management	118
5.7. Back to Zadeh's paradox	122
CHAPTER 6. DATA MODELING	127
6.1. Characterization of signals	127
6.2. Probabilities: immediate taking into account	130
6.3. Belief functions: an open-ended and overarching framework	131
6.3.1. Integration of data into the fusion process	132
6.3.2. Generic problem: modeling of C_{ij} values	135
6.3.3. Modeling measurements with stochastic learning	139

6.3.4. Modeling measurements with fuzzy learning	144
6.3.5. Overview of models for belief functions	148
6.4. Possibilities: a similar approach	153
6.5. Application to a didactic example of classification	157
CHAPTER 7. CLASSIFICATION: DECISION-MAKING AND EXPLOITATION OF THE DIVERSITY OF INFORMATION SOURCES . . .	165
7.1. Decision-making: choice of the most likely hypothesis	166
7.2. Decision-making: determination of the most likely set of hypotheses	168
7.3. Behavior of the decision operator: some practical examples	171
7.4. Exploitation of the diversity of information sources: integration of binary comparisons.	175
7.5. Exploitation of the diversity of information sources: classification on the basis of distinct but overlapping sets.	179
7.6. Exploitation of the diversity of the attributes: example of application to the fusion of airborne image data	189
CHAPTER 8. SPATIAL DIMENSION: DATA ASSOCIATION	193
8.1. Data association: a multiform problem, which is unavoidable in multisensor data fusion	194
8.2. Construction of a general method for data association	197
8.3. Simple example of the implementation of the method.	203
CHAPTER 9. TEMPORAL DIMENSION: TRACKING	211
9.1. Tracking: exploitation of the benefits of multisensor data fusion	211
9.2. Expression of the Bayesian filter	218
9.2.1. Statistical gating	218
9.2.2. Updating	219
9.2.3. Prediction	220
9.3. Signal discrimination process.	221
9.3.1. Fusion at the level of each resolution cell	222
9.3.2. Fusion at the level of the validation gate.	224
9.3.3. Overview of a practical implementation of the discrimination method	226
9.4. Extensions of the basic MSF	228
9.4.1. Data association	228
9.4.2. Joint tracking of multiple targets.	229
9.4.3. Multi-model filtering	231

9.5. Examples of application	232
9.5.1. Extraction power	233
9.5.2. Handling of unfamiliar signatures	235
9.5.3. Tracking on spatially ambiguous observations	238
CONCLUSION.	241
BIBLIOGRAPHY	249
