Contents

Introduction xi

Chapter 1. Real-time Computing 1

1.1. What are real-time systems? 2
1.1.1. The concept of “real-time” 2
1.1.2. Features and properties of real-time systems 2
1.2. Classification of real-time systems 4
1.2.1. Hard, soft or firm: which time constraints? 4
1.2.2. Event-triggered versus time-triggered: which scheduling? 6
1.3. Typical examples of real-time systems 7
1.3.1. Avionic systems 7
1.3.2. Multimedia systems 10
1.3.3. Medical systems 12
1.4. Real-time operating systems: what are their special features? 12
1.4.1. Task scheduling 13
1.4.2. Kernel preemption 14
1.4.3. Dynamic memory allocation 15
1.4.4. Interrupt handling 16
1.4.5. Hardware configurations 16

1.5. Examples of real-time operating systems for embedded systems 17
1.5.1. FreeRTOS 17
1.5.2. μC/OS-III 18
1.5.3. Keil RTX 21
1.5.4. Nucleus 22
1.5.5. ThreadX-lite 23
1.5.6. Contiki 24
1.6. Conclusion 25

Chapter 2. Principles of Real-time Scheduling 27

2.1. Characterization and models of real-time tasks 28
2.1.1. Definition 28
2.1.2. Models of tasks 30
2.2. Schedulability analysis 32
2.2.1. Basic definitions associated with schedulability analysis 33
2.2.2. Approaches to schedulability analysis 35
2.3. Uniprocessor scheduling 36
2.3.1. Classification of scheduling algorithms 36
2.3.2. Properties of scheduling algorithms 38
2.3.3. Scheduling algorithm complexity 38
2.4. Periodic task scheduling 39
2.4.1. Fixed-priority scheduling 40
2.4.2. Dynamic-priority scheduling 45
2.5. Aperiodic task servers 52
2.5.1. Approach based on background processing 52
2.5.2. Approaches based on fixed-priority servers 53
2.5.3. Approaches based on dynamic-priority servers 54
2.6. Conclusion 55

Chapter 3. Harnessing Ambient Energy for Embedded Systems 57

3.1. Why is it necessary to harvest energy from the environment? 58
3.1.1. Constantly evolving technology 58
3.1.2. Terminology 58
3.1.3. The ecological footprint 60
3.1.4. Miniaturization 61
3.1.5. Battery life 61
3.1.6. Energy saving 62
3.1.7. Summary 63
3.2. A wide range of applications 64
3.2.1. Infrastructure 64
3.2.2. Sport 65
3.2.3. Recreation 65
3.2.4. Health 66
3.2.5. Home automation and security 66
3.2.6. Transportation vehicles 67
3.3. Useful energy sources 67
3.3.1. Diversity and limitlessness 67
3.3.2. Mechanical sources 67
3.3.3. Heat 69
3.3.4. Light 70
3.3.5. The human body 72
3.3.6. Electromagnetic radiation 73
3.4. Energy storage 74
3.4.1. Introduction 74
3.4.2. Rechargeable chemical batteries 75
3.4.3. Supercapacitors 76
3.4.4. Solid-state rechargeable batteries 78
3.5. Implementation of an autonomous system 79
3.5.1. The components of an autonomous system 79

3.5.2. Energy requirements analysis 80
3.6. Current operating principles 81
3.6.1. Harvest-store-use systems 81
3.6.2. Harvest-use systems 82
3.7. Conclusion 82

Chapter 4. Energy Self-sufficiency and Real-time Scheduling 85

4.1. Time and energy: a dual constraint 86
4.2. Description of an autonomous real-time system 88
4.2.1. Hardware architecture 88
4.2.2. Software architecture 89
4.2.3. The RTEH model 89
4.2.4. Terminology 92
4.3. Key theoretical results 93
4.3.1. Shortcomings of EDF 93
4.3.2. Illustrative example 94
4.3.3. Strengths of EDF 95
4.3.4. Necessity of clairvoyance 96
4.4. Concepts 97
4.4.1. Concepts related to time 97
4.4.2. Concepts related to energy 98
4.5. The ED-H scheduler 100
4.5.1. Principles 100
4.5.2. Algorithm specification 100
4.5.3. Performance 102
4.5.4. Clairvoyance 103
4.5.5. Schedulability condition 103
4.5.6. Illustrative example 104
4.6. Another scheduling solution: LSA 105
4.6.1. Hypotheses 106
4.6.2. Principles 106
4.6.3. Schedulability condition 107
4.6.4. Illustrative example 108
4.7. Technological hurdles 109
4.7.1. Estimation of the harvested energy 109

4.7.2. Measurement of stored energy 110
4.7.3. Schedulability test 110
4.8. Conclusion 111

Conclusion 113
