<b>Foreword</b> . . . . .	xi
David POINTCHEVAL	
<b>Chapter 1. Public-Key Encryption and Security Notions</b> . . . . .	1
Nuttapong ATTRAPADUNG and Takahiro MATSUDA	
1.1. Basic definitions for PKE . . . . .	2
1.1.1. Basic notation . . . . .	2
1.1.2. Public-key encryption . . . . .	2
1.1.3. IND-CPA and IND-CCA security . . . . .	2
1.1.4. Other basic security notions and relations . . . . .	4
1.2. Basic PKE schemes . . . . .	5
1.2.1. Game-based proofs . . . . .	5
1.2.2. ElGamal encryption . . . . .	6
1.2.3. Simplified CS encryption . . . . .	8
1.2.4. Cramer–Shoup encryption . . . . .	11
1.2.5. Other specific PKE schemes . . . . .	14
1.3. Generic constructions for IND-CCA secure PKE . . . . .	16
1.3.1. Hybrid encryption . . . . .	17
1.3.2. Naor–Yung construction and extensions . . . . .	19
1.3.3. Fujisaki–Okamoto and other transforms in the RO model . . . . .	21
1.3.4. Other generic constructions for IND-CCA secure PKE . . . . .	23
1.4. Advanced topics . . . . .	25
1.4.1. Intermediate notions related to CCA . . . . .	25
1.4.2. IND-CCA security in multi-user setting and tight security . . . . .	26
1.4.3. Key-dependent message security . . . . .	28
1.4.4. More topics on PKE . . . . .	30
1.5. References . . . . .	31

<b>Chapter 2. Signatures and Security Notions</b> . . . . .	<b>47</b>
Marc FISCHLIN	
2.1. Signature schemes . . . . .	47
2.1.1. Definition . . . . .	47
2.1.2. Examples of practical schemes . . . . .	49
2.2. Unforgeability . . . . .	51
2.2.1. Discussion . . . . .	51
2.2.2. Existential unforgeability under chosen-message attacks . . . . .	53
2.2.3. Unforgeability of practical schemes . . . . .	54
2.3. Strong unforgeability . . . . .	56
2.3.1. Discussion . . . . .	56
2.3.2. Strong existential unforgeability under chosen-message attacks . . . . .	57
2.3.3. Strong unforgeability of practical schemes . . . . .	58
2.3.4. Building strongly unforgeable schemes . . . . .	59
2.4. Summary . . . . .	60
2.5. References . . . . .	60
<b>Chapter 3. Zero-Knowledge Proofs</b> . . . . .	<b>63</b>
Ivan VISCONTI	
3.1. Introduction . . . . .	63
3.2. Notation . . . . .	64
3.3. Classical zero-knowledge proofs . . . . .	64
3.3.1. Zero knowledge . . . . .	65
3.4. How to build a zero-knowledge proof system . . . . .	68
3.4.1. ZK proofs for all $\mathcal{NP}$ . . . . .	70
3.4.2. Round complexity . . . . .	71
3.5. Relaxed security in proof systems . . . . .	72
3.5.1. Honest-verifier ZK . . . . .	72
3.5.2. Witness hiding/indistinguishability . . . . .	73
3.5.3. $\Sigma$ -Protocols . . . . .	74
3.6. Non-black-box zero knowledge . . . . .	75
3.7. Advanced notions . . . . .	75
3.7.1. Publicly verifiable zero knowledge . . . . .	76
3.7.2. Concurrent ZK and more . . . . .	77
3.7.3. ZK with stateless players . . . . .	78
3.7.4. Delayed-input proof systems . . . . .	79
3.8. Conclusion . . . . .	80
3.9. References . . . . .	80

---

<b>Chapter 4. Secure Multiparty Computation</b> . . . . .	<b>85</b>
Yehuda LINDELL	
4.1. Introduction . . . . .	85
4.1.1. A note on terminology . . . . .	87
4.2. Security of MPC . . . . .	87
4.2.1. The definitional paradigm . . . . .	87
4.2.2. Additional definitional parameters . . . . .	89
4.2.3. Adversarial power . . . . .	89
4.2.4. Modular sequential and concurrent composition . . . . .	91
4.2.5. Important definitional implications . . . . .	92
4.2.6. The ideal model and using MPC in practice . . . . .	92
4.2.7. Any inputs are allowed . . . . .	92
4.2.8. MPC secures the process, but not the output . . . . .	92
4.3. Feasibility of MPC . . . . .	93
4.4. Techniques . . . . .	94
4.4.1. Shamir secret sharing . . . . .	94
4.4.2. Honest-majority MPC with secret sharing . . . . .	95
4.4.3. Private set intersection . . . . .	97
4.4.4. Threshold cryptography . . . . .	99
4.4.5. Dishonest-majority MPC . . . . .	100
4.4.6. Efficient and practical MPC . . . . .	100
4.5. MPC use cases . . . . .	101
4.5.1. Boston wage gap (Lapets et al. 2018) . . . . .	101
4.5.2. Advertising conversion (Ion et al. 2017) . . . . .	101
4.5.3. MPC for cryptographic key protection (Unbound Security; Sepior; Curv) . . . . .	101
4.5.4. Government collaboration (Sharemind) . . . . .	102
4.5.5. Privacy-preserving analytics (Duality) . . . . .	102
4.6. Discussion . . . . .	102
4.7. References . . . . .	103
<b>Chapter 5. Pairing-Based Cryptography</b> . . . . .	<b>107</b>
Olivier BLAZY	
5.1. Introduction . . . . .	108
5.1.1. Notations . . . . .	108
5.1.2. Generalities . . . . .	108
5.2. One small step for man, one giant leap for cryptography . . . . .	109
5.2.1. Opening Pandora’s box, demystifying the magic . . . . .	110
5.2.2. A new world of assumptions . . . . .	112
5.3. A new world of cryptographic protocols at your fingertips . . . . .	116
5.3.1. Identity-based encryption made easy . . . . .	117

---

5.3.2. Efficient deterministic compact signature . . . . .	118
5.4. References . . . . .	119
<b>Chapter 6. Broadcast Encryption and Traitor Tracing . . . . .</b>	<b>121</b>
Duong HIEU PHAN	
6.1. Introduction . . . . .	121
6.2. Security notions for broadcast encryption and TT . . . . .	123
6.3. Overview of broadcast encryption and TT . . . . .	125
6.4. Tree-based methods . . . . .	129
6.5. Code-based TT . . . . .	132
6.6. Algebraic schemes . . . . .	135
6.7. Lattice-based approach with post-quantum security . . . . .	142
6.8. References . . . . .	143
<b>Chapter 7. Attribute-Based Encryption . . . . .</b>	<b>151</b>
Romain GAY	
7.1. Introduction . . . . .	151
7.2. Pairing groups . . . . .	152
7.2.1. Cyclic groups . . . . .	152
7.2.2. Pairing groups . . . . .	152
7.3. Predicate encodings . . . . .	153
7.3.1. Definition . . . . .	153
7.3.2. Constructions . . . . .	154
7.4. Attribute-based encryption . . . . .	156
7.4.1. Definition . . . . .	156
7.4.2. A modular construction . . . . .	158
7.5. References . . . . .	165
<b>Chapter 8. Advanced Signatures . . . . .</b>	<b>167</b>
Olivier SANDERS	
8.1. Introduction . . . . .	167
8.2. Some constructions . . . . .	169
8.2.1. The case of scalar messages . . . . .	169
8.2.2. The case of non-scalar messages . . . . .	171
8.3. Applications . . . . .	173
8.3.1. Anonymous credentials . . . . .	173
8.3.2. Group signatures . . . . .	176
8.3.3. Direct anonymous attestations . . . . .	180
8.4. References . . . . .	184

<b>Chapter 9. Key Exchange</b> . . . . .	187
Colin BOYD	
9.1. Key exchange fundamentals . . . . .	187
9.1.1. Key exchange parties . . . . .	188
9.1.2. Key exchange messages . . . . .	189
9.1.3. Key derivation functions . . . . .	189
9.2. Unauthenticated key exchange . . . . .	191
9.2.1. Formal definitions and security models . . . . .	191
9.2.2. Constructions and examples . . . . .	192
9.3. Authenticated key exchange . . . . .	194
9.3.1. Non-interactive key exchange . . . . .	195
9.3.2. AKE security models . . . . .	196
9.3.3. Constructions and examples . . . . .	200
9.4. Conclusion . . . . .	206
9.5. References . . . . .	207
<b>Chapter 10. Password Authenticated Key Exchange: Protocols and Security Models</b> . . . . .	213
Stanislaw JARECKI	
10.1. Introduction . . . . .	213
10.2. First PAKE: EKE . . . . .	215
10.3. Game-based model of PAKE security . . . . .	218
10.3.1. The BPR security model . . . . .	218
10.3.2. Implicit versus explicit authentication . . . . .	221
10.3.3. Limitations of the BPR model . . . . .	221
10.3.4. EKE instantiated with Diffie–Hellman KE . . . . .	223
10.3.5. Implementing ideal cipher on arbitrary groups . . . . .	224
10.4. Simulation-based model of PAKE security . . . . .	225
10.4.1. The BMP security model . . . . .	225
10.4.2. Advantages of BMP definition: arbitrary passwords, tight security . . . . .	229
10.4.3. EKE using RO-derived one-time pad encryption . . . . .	230
10.4.4. BMP model for PAKE with explicit authentication (PAKE-EA) . . . . .	231
10.5. Universally composable model of PAKE security . . . . .	232
10.6. PAKE protocols in the standard model . . . . .	236
10.7. PAKE efficiency optimizations . . . . .	239
10.8. Asymmetric PAKE: PAKE for the client-server setting . . . . .	242
10.9. Threshold PAKE . . . . .	244
10.10. References . . . . .	246

<b>Chapter 11. Verifiable Computation and Succinct Arguments for NP</b>	257
Dario FIORE	
11.1. Introduction	257
11.1.1. Background	258
11.2. Preliminaries	259
11.3. Verifiable computation	260
11.4. Constructing VC	261
11.4.1. VC for circuits in three steps	261
11.4.2. Succinct non-interactive arguments for non-deterministic computation	263
11.4.3. Verifiable computation from SNARG	264
11.5. A modular construction of SNARGs	264
11.5.1. Algebraic non-interactive linear proofs	265
11.5.2. Bilinear groups	267
11.5.3. SNARGs from algebraic NILPs with degree-2 verifiers using bilinear groups	269
11.6. Constructing algebraic NILPs for arithmetic circuits	271
11.6.1. Arithmetic circuits	271
11.6.2. Quadratic arithmetic programs	271
11.6.3. Algebraic NILP for QAPs	274
11.7. Conclusion	279
11.8. References	279
