Notations	ix
Introduction	xiii
Chapter 1. Projection of fBm on the Space of Martingales	1
1.1. fBm and its integral representations	2
1.2. Formulation of the main problem	5
1.3. The lower bound for the distance between fBm and Gaussian martingales	8
1.4. The existence of minimizing function for the principal functional	10
1.5. An example of the principal functional with infinite set of minimizing functions	12
1.6. Uniqueness of the minimizing function for functional with the Molchan kernel and $H \in (\frac{1}{2}, 1)$	17
1.7. Representation of the minimizing function	21
1.7.1. Auxiliary results	21
1.7.2. Main properties of the minimizing function	28
1.8. Approximation of a discrete-time fBm by martingales	31
1.8.1. Description of the discrete-time model	31
1.8.2. Iterative minimization of the squared distance using alternating minimization method	33
1.8.3. Implementation of the alternating minimization algorithm	43
1.8.4. Computation of the minimizing function	44
1.9. Exercises	50

Chapter 2. Distance Between fBm and Subclasses of Gaussian Martingales	53
2.1. fBm and Wiener integrals with power functions	54
2.1.1. fBm and Wiener integrals with constant integrands	54
2.1.2. fBm and Wiener integrals involving power integrands with a positive exponent	57
2.1.3. fBm and integrands $a(s)$ with $a(s)s^{-\alpha}$ non-decreasing	65
2.1.4. fBm and Gaussian martingales involving power integrands with a negative exponent	67
2.1.5. fBm and the integrands $a(s) = a_0s^\alpha + a_1s^{\alpha+1}$	80
2.1.6. fBm and Wiener integrals involving integrands $k_1 + k_2s^\alpha$	84
2.2. The comparison of distances between fBm and subspaces of Gaussian martingales	109
2.2.1. Summary of the results concerning the values of the distances	109
2.2.2. The comparison of distances	112
2.2.3. The comparison of upper and lower bounds for the constant c_H	113
2.3. Distance between fBm and class of “similar” functions	118
2.3.1. Lower bounds for the distance	121
2.3.2. Evaluation	124
2.4. Distance between fBm and Gaussian martingales in the integral norm	127
2.5. Distance between fBm with Mandelbrot–Van Ness kernel and Gaussian martingales	129
2.5.1. Constant function as an integrand	129
2.5.2. Power function as an integrand	131
2.5.3. Comparison of Molchan and Mandelbrot–Van Ness kernels	132
2.6. fBm with the Molchan kernel and $H \in (0, \frac{1}{2})$, in relation to Gaussian martingales	133
2.7. Distance between the Wiener process and integrals with respect to fBm	138
2.7.1. Wiener integration with respect to fBm	138
2.7.2. Wiener process and integrals of power functions with respect to fBm	140
2.8. Exercises	150

Chapter 3. Approximation of fBm by Various Classes of Stochastic Processes	153
3.1. Approximation of fBm by uniformly convergent series of Lebesgue integrals	153
3.2. Approximation of fBm by semimartingales	157
3.2.1. Construction and convergence of approximations	157
3.2.2. Approximation of an integral with respect to fBm by integrals with respect to semimartingales	159
3.3. Approximation of fBm by absolutely continuous processes	164
3.4. Approximation of multifractional Brownian motion by absolutely continuous processes	171
3.4.1. Definition and examples	171
3.4.2. Hölder continuity	173
3.4.3. Construction and convergence of approximations	175
3.5. Exercises	180
Appendix 1. Auxiliary Results from Mathematical, Functional and Stochastic Analysis	181
Appendix 2. Evaluation of the Chebyshev Center of a Set of Points in the Euclidean Space	205
Appendix 3. Simulation of fBm	239
Solutions	251
