Introduction	xi
Chapter 1. CFD Numerical Models	1
1.1. Compressible flow	1
1.1.1. Introduction	1
1.1.2. Spatial representation	4
1.1.3. Spatial second-order accuracy: MUSCL	13
1.1.4. Low dissipation advection schemes	16
1.1.5. Time advancing	17
1.1.6. Positivity of mixed element-volume formulations	20
1.2. Viscous compressible flows	27
1.2.1. Model for laminar flows	27
1.2.2. Boundary conditions spatial discretization	31
1.2.3. No-slip boundary condition	31
1.2.4. Slip boundary condition	31
1.2.5. Influence stencil	32
1.2.6. Spalart–Allmaras one equation turbulence model	33
1.2.7. SA one-equation model without trip and without f_{t2} term	33
1.2.8. “Standard” SA one-equation model (without trip)	35
1.2.9. “Full” SA one-equation model (with trip)	35
1.2.10. Mixed element-volume discretization of SA	35
1.2.11. Implicit time integration	39
1.3. A multi-fluid incompressible model	40
1.3.1. Introduction	40
1.3.2. Bi-fluid incompressible Navier–Stokes equations	40
1.3.3. Finite element approximation	42
1.3.4. Error estimate for the level set advection	44

1.3.5. Provisional conclusion on scheme accuracy	46
1.4. Appendix: circumcenter cells	47
1.4.1. Two-dimensional circumcenter cells	47
1.4.2. Three-dimensional circumcenter cells	48
1.5. Notes	49
Chapter 2. Mesh Convergence and Barriers	51
2.1. Introduction	51
2.2. The early capturing property	53
2.2.1. Smoothness, non-smoothness, heterogeneity	53
2.2.2. Behavior of the uniform-mesh strategy	54
2.2.3. An example of 1D adaptation	56
2.3. Unstructured meshes in finite element method	58
2.3.1. Basics of finite element meshes	58
2.3.2. Anisotropy	59
2.4. Accuracy of an interpolation	60
2.5. Isotropic adaptative interpolation	61
2.5.1. The 2D case	61
2.5.2. A first 3D case	62
2.5.3. A limiting barrier for the isotropic 3D case	64
2.6. Anisotropic adaptative interpolation	64
2.6.1. Anisotropic adaptation of a Heaviside function	64
2.6.2. Heaviside function with curved discontinuity	66
2.7. Numerical illustration: anisotropic versus isotropic interpolation	67
2.8. CFD applications of anisotropic capture	68
2.8.1. Pressure with discontinuous gradient	68
2.8.2. Scramjet flow	68
2.9. Unsteady case	71
2.9.1. Barriers for second-order time-leveled case	72
2.9.2. Barriers for third-order time-leveled case	74
2.10. Conclusion	75
2.11. Notes	76
Chapter 3. Mesh Representation	77
3.1. Introduction	77
3.2. An introductory example	78
3.3. Euclidean metric space	81
3.3.1. Geometric interpretation	84
3.3.2. Natural metric mapping	85
3.4. Riemannian metric space	85
3.5. Generation of adapted anisotropic meshes	90
3.5.1. Unit element	90
3.5.2. Geometric invariants	92

3.5.3. Global duality	95
3.5.4. Quantifying mesh anisotropy	103
3.6. Operations on metrics	104
3.6.1. Metric intersection	104
3.6.2. Metric interpolation	106
3.7. Computation of geometric quantities	108
3.7.1. Computation of lengths	108
3.7.2. Computation of volumes	110
3.8. Notes	110
3.8.1. A short history	110

Chapter 4. Geometric Error Estimate 113

4.1. The 1D case	114
4.1.1. 1D metric	114
4.1.2. P^1 Interpolation error bound	115
4.1.3. 1D optimal metric	116
4.1.4. Convergence order of the continuous metric model	118
4.2. Discrete-continuous duality for linear interpolation error	120
4.2.1. Interpolation error in \mathbf{L}^1 norm for quadratic functions	121
4.2.2. Linear interpolation on a continuous element	124
4.2.3. Continuous linear interpolate	126
4.3. Numerical validation of the continuous interpolation error	133
4.3.1. Continuous interpolation error calculation	134
4.3.2. Comparison with discrete interpolation error computation	138
4.3.3. Three-dimensional validation	142
4.3.4. Some conclusions	146
4.4. Optimal control of the interpolation error in \mathbf{L}^p norm	147
4.4.1. Formal resolution	147
4.4.2. Uniqueness	150
4.4.3. Optimal orientations and main result	151
4.5. Multidimensional discontinuity capturing	154
4.6. Linear interpolate operator	155
4.7. A local \mathbf{L}^∞ upper bound of the interpolation error	156
4.8. Metric construction for mesh adaptation	159
4.8.1. Handling degenerated cases	161
4.8.2. Isotropic mesh adaptation	162
4.9. Mesh adaptation for analytical functions	162
4.9.1. Algorithms	162
4.9.2. Examples of L^∞ adaptation	163
4.10. Conclusion	170
4.11. Notes	171

Chapter 5. Multiscale Adaptation for Steady Simulations	173
5.1. Introduction	173
5.2. Definitions and notations (2D)	174
5.3. Solving the problematic of the unknown solution (2D/3D)	176
5.4. Numerical computation/recovery of the Hessian matrix	179
5.4.1. Numerical computation of nodal gradients (2D)	179
5.4.2. A double L^2 -projection method	180
5.4.3. A method based on the Green formula	181
5.4.4. A least-square approach	181
5.4.5. From our experience	183
5.4.6. Discrete-continuous interpolation	183
5.5. Solution interpolation	183
5.5.1. Localization algorithm	183
5.5.2. Classical polynomial interpolation	187
5.6. Mesh adaptation algorithm	189
5.7. Example of a CFD numerical simulation	190
5.8. Conclusion	191
5.9. Notes	191
5.9.1. A short review of mesh/PDE coupling	191
Chapter 6. Multiscale Convergence and Certification in CFD	195
6.1. Introduction	195
6.2. A mesh convergence algorithm	197
6.2.1. Mesh adaptation with a fixed complexity	198
6.2.2. Transfers and numerical convergence	199
6.3. An academic test case	201
6.3.1. Uniform refinement study	201
6.3.2. Isotropic adaptation study	203
6.3.3. Anisotropic adaptation study	203
6.3.4. Error level	204
6.4. 3D multiscale anisotropic mesh adaptation	205
6.5. Conclusion	206
6.6. Notes	208
