Introduction	ix
Patrice PEYRE and Éric CHARKALUK	
Chapter 1. Metal Additive Manufacturing Processes	1
Patrice PEYRE	
1.1. The DED-LMD process	3
1.1.1. Process overview	3
1.1.2. Basic elements	4
1.1.3. Overview of process parameters and their influence	8
1.1.4. Thermal cycles induced by the process	13
1.1.5. Types of materials involved	15
1.1.6. Microstructures of manufactured or repaired parts	15
1.1.7. Industrial systems	16
1.2. The L-PBF process	21
1.2.1. Distinction between sintering and laser melting	21
1.2.2. Manufacturer interests and requirements	21
1.2.3. Process principle and basic elements	24
1.2.4. Types of materials involved	27
1.2.5. Presentation and influence of the process operating parameters	28
1.2.6. Comparison of the L-PBF process and DED process	31
1.2.7. Design and manufacturing method of a part	32
1.2.8. Area of stable melt-pool suitable for construction	37
1.2.9. Optimization of L-PBF manufacturing of 3D parts	38

1.3. Electron powder bed fusion	39
1.3.1. Introduction	39
1.3.2. Implementation of the E-PBF process	40
1.3.3. Optimization of melting conditions and characteristic defects	47
1.3.4. Other characteristics of the E-PBF process	52
1.3.5. Partial conclusion regarding E-PBF	57
1.4. The deposition of matter via WAAM	58
1.4.1. Arc/wire additive manufacturing technologies	58
1.4.2. WAAM process parameters	62
1.4.3. Use of materials	64
1.4.4. Residual stresses and distortions	67
1.4.5. Finishing process	68
1.4.6. Digital chain: online control	69
1.4.7. Conclusion	72
1.5. Emerging processes	72
1.5.1. Indirect fabrication by selective laser sintering and infiltration	72
1.5.2. Indirect manufacture via metal binder jetting	78
1.5.3. Direct manufacture in the solid state without melting	81
1.6. Conclusion	87
1.7. References	89
Chapter 2. Raw Materials: Metal Powders and Wires	97
Marc THOMAS	
2.1. Metal powders	97
2.1.1. Introduction	97
2.1.2. Producing powders	99
2.1.3. Physico-chemical properties of powders	115
2.1.4. Rheological properties of powders	117
2.1.5. Influence of powders on processes and final properties	125
2.1.6. Standardization	128
2.1.7. Summary	129
2.2. Metal wires	130
2.2.1. Introduction	130
2.2.2. Wire production	132
2.2.3. Use of filler wires in AM	135
2.2.4. Influence of wires on processes and final properties	137

2.2.5. Summary	146
2.3. References	147

Chapter 3. The Physics of Metal Additive Manufacturing Processes

Patrice PEYRE

3.1. The energy–powder–fusion zone interaction in additive laser fusion processes	151
3.1.1. Introduction	151
3.1.2. Reminder of the essential physical variables	152
3.1.3. Radiation absorption and heat transfer: different interaction regimes for different processes	153
3.1.4. Local thermal cycles: influence of boundary conditions	163
3.1.5. Hydrodynamics of fusion zones and associated faults	164
3.1.6. Partial conclusion regarding the physics of laser additive manufacturing processes	171
3.2. The physics of the E-PBF process	171
3.2.1. Introduction	171
3.2.2. Reminder of the essential physical variables characteristic of the electron–matter interaction	171
3.2.3. The phenomena induced during the electron–matter interaction	173
3.2.4. Energy absorption in the powder in E-PBF	177
3.2.5. Description of the fusion zone in E-PBF and associated defects	180
3.2.6. Partial conclusion regarding E-PBF	183
3.3. Physics of the wire arc additive manufacturing process	183
3.3.1. Reminder of the essential physical variables	184
3.3.2. Arc–wire–deposit interaction	186
3.3.3. Form of deposits and associated defects	193
3.4. Conclusion	196
3.5. References	196

Chapter 4. Numerical Simulation of Additive Manufacturing Processes

Muriel CARIN

4.1. Thermo-hydrodynamic simulation	201
4.1.1. Description of physical phenomena	201
4.1.2. Modeling of heat source	203

4.1.3. Modeling of material input	206
4.1.4. Numerical methods for deposition modeling	208
4.1.5. Modeling of heat and mass transfer in the melt-pool	210
4.1.6. Examples of thermo-hydrodynamic simulations	213
4.2. Thermomechanical simulation	221
4.2.1. Whole-part simulation: different techniques	223
4.2.2. Heat transfer resolution	224
4.2.3. Metallurgical resolution	225
4.2.4. Mechanical resolution	230
4.2.5. Coupling	232
4.2.6. Application at the mesoscopic scale: local manufacturing stresses	233
4.2.7. Application at the macroscopic scale	234
4.2.8. Software and calculation codes dedicated to additive manufacturing	238
4.3. Conclusion	238
4.4. References	239
Conclusion	243
