<b>Preface</b> . . . . .	xi
Abdelghani SAOUAB, Stéphane CHAMPMARTIN and Jaafar Khalid NACIRI	
<b>Chapter 1. Kinetics of Microphase Separation in Interpenetrating Polymer Gels</b> . . . . .	1
Mabrouk BENHAMOU	
1.1. Introduction. . . . .	1
1.2. Static study of microphase separation . . . . .	3
1.3. Kinetic study of microphase separation . . . . .	5
1.4. Discussion . . . . .	9
1.5. References . . . . .	11
<b>Chapter 2. Physics of Hydrodynamic Interactions</b> . . . . .	15
Stéphane CHAMPMARTIN	
2.1. Introduction. . . . .	15
2.2. Equations of low Reynolds number fluid mechanics . . . . .	18
2.3. Resistance matrix . . . . .	21
2.4. Sphere in hydrodynamic interaction in a cylindrical tube. . . . .	22
2.5. Pair of spheres in hydrodynamic interaction . . . . .	30
2.6. Conclusion . . . . .	34
2.7. References . . . . .	34

<b>Chapter 3. Stokes Flows – Applications to Creeping Flows Around Obstacles and to Flows in Porous Media</b> . . . . .	37
Mustapha HELLOU, Mohammed Khaled BOURBATACHE and Franck LOMINÉ	
3.1. Introduction. . . . .	37
3.2. Several solutions to the Stokes equation in two-dimensional flow . . . . .	39
3.2.1. Solution to the Stokes equation in Cartesian coordinates . . . . .	40
3.2.2. Solution to the Stokes equation in polar coordinates . . . . .	42
3.2.3. Solution to the Stokes equation in elliptical coordinates . . . . .	43
3.3. Application to flows around obstacles . . . . .	44
3.3.1. Calculation of arbitrary coefficients of semi-analytical solutions. . . . .	44
3.3.2. Flows in a junction of orthogonal channels. . . . .	45
3.3.3. Flows around networks of circular obstacles. . . . .	52
3.3.4. Stokes flow around an elliptical obstacle . . . . .	55
3.4. Application to the calculation of the permeability of periodical porous media. . . . .	56
3.4.1. Two-dimensional flow. . . . .	56
3.4.2. Three-dimensional porous media . . . . .	59
3.5. Conclusion . . . . .	63
3.6. References . . . . .	64
<b>Chapter 4. The Yield Stress Method for the Characterization of Pore Size Distribution of Porous Media: Progress Review</b> . . . . .	67
Antonio RODRIGUEZ DE CASTRO, Azita AHMADI-SENICHAULT and Abdelaziz OMARI	
4.1. Introduction. . . . .	67
4.2. Yield stress method . . . . .	70
4.3. Experimental validation of YSM method . . . . .	74
4.3.1. Aqueous solutions of xanthan gum as injection fluid in YSM method. . . . .	74
4.3.2. Experimental set-up and procedure . . . . .	76
4.3.3. Unconsolidated porous media: packs of spheres. . . . .	77
4.3.4. Consolidated porous media: experiment on the core . . . . .	78
4.4. Physical significance of the pore size characterized by YSM . . . . .	80
4.4.1. Pore network modeling . . . . .	80
4.4.2. Comparison of PSD provided by YSM, MIP and by imaging. . . . .	81
4.5. Extension of YSM to rough fractures . . . . .	84
4.6. Conclusion . . . . .	90
4.7. References . . . . .	90

---

**Chapter 5. Instabilities and Transition to Turbulence in the Couette–Taylor Flow of a Shear-thinning Viscoelastic Liquid . . . . .** 95

Noureddine LATRACHE, Fayçal KELAI, Olivier CRUMEYROLLE  
and Innocent MUTABAZI

5.1. Introduction. . . . .	95
5.2. Experimental set-up and physicochemical characterization of the polymer . . . . .	99
5.3. Results. . . . .	101
5.3.1. Stability diagram . . . . .	101
5.3.2. Characterization of defects . . . . .	104
5.3.3. Characterization of the flame pattern . . . . .	105
5.3.4. Spiral pattern at the threshold near the walls. . . . .	107
5.3.5. Discussion of wall modes using complex Ginzburg–Landau equations . . . . .	111
5.3.6. Evolution of the size occupied by spirals as a function of $Ta$ . . . . .	116
5.4. Conclusion . . . . .	117
5.5. References . . . . .	118

**Chapter 6. Application of the WKB Method to the Study of Flow Stability Generated by Low-frequency Modulation of Boundary Conditions . . . . .** 121

Saïd ANISS and Mouh ASSOUL

6.1. Introduction. . . . .	122
6.1.1. Instabilities of unsteady base states . . . . .	122
6.1.2. Gravitational modulation . . . . .	122
6.1.3. Modulation of boundary conditions . . . . .	123
6.1.4. Modulation of boundary conditions in Taylor–Couette geometry . . . . .	123
6.1.5. Modulation of boundary conditions relative to temperature. . . . .	125
6.1.6. Modulation of boundary conditions related to the heat flux imposed in Bénard–Marangoni convection . . . . .	126
6.1.7. Objectives of the chapter – modulation of boundary conditions at low frequency and WKB method. . . . .	126
6.2. Application of WKB method for studying the effect of low-frequency phase modulation of temperature on the convection threshold of a fluid layer. . . . .	127
6.2.1. Thermal configuration . . . . .	127
6.2.2. Formulation of the problem of base solution stability . . . . .	128
6.2.3. Low-frequency asymptotic analysis WKB . . . . .	130
6.2.4. Numerical procedure . . . . .	132
6.2.5. Asymptotic laws of the critical Rayleigh number and wave number at low frequencies . . . . .	136

6.3. Application of the WKB method to the study of pulsed flow stability generated by in-phase low-frequency oscillation, in Taylor–Couette geometry . . . . .	138
6.3.1. Configuration of the studied flow . . . . .	138
6.3.2. Formulation of the linear stability problem of the basic solution . . . . .	139
6.3.3. Asymptotic analysis for low frequencies – WKB method . . . . .	141
6.3.4. Asymptotic laws of critical Taylor and wave numbers at low frequencies . . . . .	143
6.4. Conclusion . . . . .	145
6.5. References . . . . .	145
<b>Chapter 7. Multiplicity of Convective Flows in a Horizontal Annular Layer.</b> . . . . .	151
Abdelkader MOJTABI and Marie-Catherine CHARRIER-MOJTABI	
7.1. Introduction. . . . .	151
7.1.1. In fluid medium . . . . .	152
7.1.2. In porous medium . . . . .	154
7.2. Mathematical formulation . . . . .	158
7.3. Various analytical solutions obtained in natural convection . . . . .	159
7.4. Analytical solution of the convective flow for small annular spaces . . . . .	160
7.5. Linear stability analysis of the analytically obtained single-cell flow. . . . .	162
7.5.1. Stability of this solution with respect to $(r, z)$ axisymmetric perturbation . . . . .	163
7.5.2. Linear stability study of this basic solution in the limit case $\varepsilon \rightarrow 0$ (axisymmetric 2D perturbation $(x, z)$ ) . . . . .	165
7.5.3. Linear stability equations in relation with 2D perturbations in the $(r, \theta)$ plane. . . . .	166
7.6. Conclusion . . . . .	168
7.7. References . . . . .	170
<b>Chapter 8. Instability Modeling in Structural Mechanics: Buckling and Wrinkling</b> . . . . .	173
Noureddine DAMIL and Michel POTIER-FERRY	
8.1. Introduction. . . . .	173
8.2. Classical multi-scale asymptotic approach to instabilities . . . . .	176
8.2.1. Linear stability analysis . . . . .	177
8.2.2. Landau–Ginzburg asymptotic approach . . . . .	178
8.3. Another multiple scale method for modeling instabilities: Fourier series with slowly varying coefficients . . . . .	180
8.3.1. New macroscopic models . . . . .	180

8.3.2. A model with five harmonics . . . . .	183
8.4. Various macroscopic models used to describe the formation of instability patterns . . . . .	185
8.4.1. Boundary conditions associated with macroscopic models . . . . .	187
8.4.2. Numerical evaluations of macroscopic models . . . . .	189
8.5. A 2D Fourier double scale analysis of global-local instability interaction in sandwich structures . . . . .	194
8.5.1. The initial 2D sandwich model . . . . .	194
8.5.2. A 2D macroscopic sandwich model . . . . .	195
8.5.3. Interaction between global buckling and local wrinkling in 2D sandwich structures . . . . .	197
8.6. A reduced model based on the multiple scale method in the case of a wrinkling with variable orientation . . . . .	199
8.6.1. Context of macroscopic modeling for wrinkling with variable orientations . . . . .	199
8.6.2. Numerical examples and discussions . . . . .	200
8.7. Conclusion . . . . .	207
8.8. References . . . . .	207
<b>Chapter 9. Electrochemical Methods for the Study of Wall Transfer Phenomena . . . . .</b>	<b>213</b>
Claude DESLOUIS, Bernard TRIBOLLET, Abdellah ARHALIASS and Jack LEGRAND	
9.1. Introduction. . . . .	213
9.2. Principles and definitions. . . . .	215
9.3. Results in Newtonian fluids . . . . .	218
9.3.1. Laminar flow and average turbulence quantities . . . . .	218
9.3.2. Access to time depending hydrodynamic quantities . . . . .	224
9.4. Electrochemical measurements in non-Newtonian media . . . . .	231
9.4.1. Long chain linear polymer solutions. . . . .	232
9.4.2. Surfactant solutions. . . . .	239
9.4.3. Electrochemical measurements in other viscoelastic aqueous or organic media . . . . .	242
9.5. Conclusion . . . . .	244
9.6. References . . . . .	244
<b>Chapter 10. Simulation of the Resin Infusion Process using the Multilayer Approach: An Industrial Case Application . . . . .</b>	<b>251</b>
Raounak LOUDAD, Abdelghani SAOUAB and Pierre BEAUCHENE	
10.1. Introduction . . . . .	251

10.2. Mathematical modeling . . . . .	254
10.3. Numerical approach . . . . .	255
10.4. Analytical modeling of 1D VARI . . . . .	257
10.5. Model validation . . . . .	260
10.5.1. Analytical/numerical comparison. . . . .	260
10.5.2. Experimental validation . . . . .	262
10.6. Industrial application . . . . .	269
10.6.1. Presentation of the demonstrator . . . . .	269
10.6.2. Geometry meshing . . . . .	271
10.6.3. Comparison of numerical results and demonstrator infusion. . . . .	272
10.7. Conclusion . . . . .	274
10.8. References. . . . .	275
<b>List of Authors</b> . . . . .	279
<b>Index</b> . . . . .	283
