<b>Introduction</b> . . . . .	ix
<b>Part 1. Multiscale Topology Optimization in the Context of Non-separated Scales</b> . . . . .	1
<b>Chapter 1. Size Effect Analysis in Topology Optimization for Periodic Structures Using the Classical Homogenization</b> . . . . .	3
1.1. The classical homogenization method . . . . .	4
1.1.1. Localization problem . . . . .	4
1.1.2. Definition and computation of the effective material properties . . . . .	7
1.1.3. Numerical implementation for the local problem with PER . . . . .	9
1.2. Topology optimization model and procedure . . . . .	10
1.2.1. Optimization model and sensitivity number . . . . .	10
1.2.2. Finite element meshes and relocalization scheme . . . . .	12
1.2.3. Optimization procedure . . . . .	14
1.3. Numerical examples . . . . .	16
1.3.1. Doubly clamped elastic domain . . . . .	17
1.3.2. L-shaped structure . . . . .	19
1.3.3. MBB beam . . . . .	24
1.4. Concluding remarks . . . . .	25

<b>Chapter 2. Multiscale Topology Optimization of Periodic Structures Taking into Account Strain Gradient</b> . . . . .	29
2.1. Non-local filter-based homogenization for non-separated scales . . . . .	30
2.1.1. Definition of local and mesoscopic fields through the filter . . . . .	30
2.1.2. Microscopic unit cell calculations . . . . .	33
2.1.3. Mesoscopic structure calculations . . . . .	39
2.2. Topology optimization procedure . . . . .	41
2.2.1. Model definition and sensitivity numbers . . . . .	41
2.2.2. Overall optimization procedure . . . . .	42
2.3. Validation of the non-local homogenization approach . . . . .	43
2.4. Numerical examples . . . . .	45
2.4.1. Cantilever beam with a concentrated load . . . . .	46
2.4.2. Four-point bending lattice structure . . . . .	52
2.5. Concluding remarks . . . . .	55
<b>Chapter 3. Topology Optimization of Meso-structures with Fixed Periodic Microstructures</b> . . . . .	57
3.1. Optimization model and procedure . . . . .	58
3.2. Numerical examples . . . . .	61
3.2.1. A double-clamped beam . . . . .	61
3.2.2. A cantilever beam . . . . .	64
3.3. Concluding remarks . . . . .	66
<b>Part 2. Topology Optimization for Maximizing the Fracture Resistance</b> . . . . .	67
<b>Chapter 4. Topology Optimization for Optimal Fracture Resistance of Quasi-brittle Composites</b> . . . . .	69
4.1. Phase field modeling of crack propagation . . . . .	71
4.1.1. Phase field approximation of cracks . . . . .	71
4.1.2. Thermodynamics of the phase field crack evolution . . . . .	72

4.1.3. Weak forms of displacement and phase field problems . . . . .	75
4.1.4. Finite element discretization . . . . .	76
4.2. Topology optimization model for fracture resistance . . . . .	78
4.2.1. Model definitions . . . . .	78
4.2.2. Sensitivity analysis . . . . .	80
4.2.3. Extended BESO method . . . . .	85
4.3. Numerical examples . . . . .	87
4.3.1. Design of a 2D reinforced plate with one pre-existing crack notch . . . . .	88
4.3.2. Design of a 2D reinforced plate with two pre-existing crack notches . . . . .	93
4.3.3. Design of a 2D reinforced plate with multiple pre-existing cracks . . . . .	96
4.3.4. Design of a 3D reinforced plate with a single pre-existing crack notch surface . . . . .	98
4.4. Concluding remarks . . . . .	101

**Chapter 5. Topology Optimization for Optimal Fracture Resistance Taking into Account Interfacial Damage . . . . . 103**

5.1. Phase field modeling of bulk crack and cohesive interfaces . . . . .	104
5.1.1. Regularized representation of a discontinuous field . . . . .	104
5.1.2. Energy functional . . . . .	106
5.1.3. Displacement and phase field problems . . . . .	108
5.1.4. Finite element discretization and numerical implementation . . . . .	111
5.2. Topology optimization method . . . . .	114
5.2.1. Model definitions . . . . .	114
5.2.2. Sensitivity analysis . . . . .	116
5.3. Numerical examples . . . . .	119
5.3.1. Design of a plate with one initial crack under traction . . . . .	120

5.3.2. Design of a plate without initial cracks for traction loads . . . . .	123
5.3.3. Design of a square plate without initial cracks in tensile loading . . . . .	125
5.3.4. Design of a plate with a single initial crack under three-point bending . . . . .	128
5.3.5. Design of a plate containing multiple inclusions . . . . .	130
5.4. Concluding remarks . . . . .	133
<b>Chapter 6. Topology Optimization for Maximizing the Fracture Resistance of Periodic Composites . . . . .</b>	<b>135</b>
6.1. Topology optimization model . . . . .	136
6.2. Numerical examples . . . . .	138
6.2.1. Design of a periodic composite under three-point bending . . . . .	138
6.2.2. Design of a periodic composite under non-symmetric three-point bending . . . . .	146
6.3. Concluding remarks . . . . .	151
<b>Conclusion . . . . .</b>	<b>153</b>
