Foreword	xi
Preface	xiii
Chapter 1. Schrödinger's Equation and its Applications	1
1.1. Physical state and physical quantity	2
1.1.1. Dynamic state of a particle	2
1.1.2. Physical quantities associated with a particle	3
1.2. Square-summable wave function	3
1.2.1. Definition, superposition principle	3
1.2.2. Properties	4
1.3. Operator	5
1.3.1. Definition of an operator, examples	5
1.3.2. Hermitian operator	5
1.3.3. Linear observable operator	7
1.3.4. Correspondence principle, Hamiltonian	8
1.4. Evolution of physical systems	11
1.4.1. Time-dependent Schrödinger equation	11
1.4.2. Stationary Schrödinger equation	12
1.4.3. Evolution operator	14
1.5. Properties of Schrödinger's equation	15
1.5.1. Determinism in the evolution of physical systems	15
1.5.2. Superposition principle	15
1.5.3. Probability current density	16
1.6. Applications of Schrödinger's equation	19
1.6.1. Infinitely deep potential well	19
1.6.2. Potential step	24
1.6.3. Potential barrier, tunnel effect	32

1.6.4. Quantum dot	39
1.6.5. Ground state energy of hydrogen-like systems	42
1.7. Exercises	45
1.7.1. Exercise 1 – Probability current density	45
1.7.2. Exercise 2 – Heisenberg’s spatial uncertainty relations	46
1.7.3. Exercise 3 – Finite-depth potential step	47
1.7.4. Exercise 4 – Multistep potential	48
1.7.5. Exercise 5 – Particle confined in a rectangular potential	50
1.7.6. Exercise 6 – Square potential well: unbound states	51
1.7.7. Exercise 7 – Square potential well: bound states	52
1.7.8. Exercise 8 – Infinitely deep rectangular potential well	53
1.7.9. Exercise 9 – Metal assimilated to a potential well, cold emission	54
1.7.10. Exercise 10 – Ground state energy of the harmonic oscillator	56
1.7.11. Exercise 11 – Quantized energy of the harmonic oscillator	57
1.7.12. Exercise 12 – HCl molecule assimilated to a linear oscillator	58
1.7.13. Exercise 13 – Quantized energy of hydrogen-like systems.	59
1.7.14. Exercise 14 – Line integral of the probability current density vector, Bohr’s magneton	60
1.7.15. Exercise 15 – The Schrödinger equation in the presence of a magnetic field, Zeeman–Lorentz triplet	62
1.7.16. Exercise 16 – Deduction of the stationary Schrödinger equation from De Broglie relation	63
1.8. Solutions	65
1.8.1. Solution 1 – Probability current density.	65
1.8.2. Solution 2 – Heisenberg’s spatial uncertainty relations	67
1.8.3. Solution 3 – Finite-depth potential step	70
1.8.4. Solution 4 – Multistep potential	74
1.8.5. Solution 5 – Particle confined in a rectangular potential	77
1.8.6. Solution 6 – Square potential well: unbound states	81
1.8.7. Solution 7 – Square potential well: bound states	86
1.8.8. Solution 8 – Infinitely deep rectangular potential well	94
1.8.9. Solution 9 – Metal assimilated to a potential well, cold emission	99
1.8.10. Solution 10 – Ground state energy of the harmonic oscillator	101
1.8.11. Solution 11 – Quantized energy of the harmonic oscillator	104
1.8.12. Solution 12 – HCl molecule assimilated to a linear oscillator	108
1.8.13. Solution 13 – Quantized energy of hydrogen-like systems.	112
1.8.14. Solution 14 – Line integral of the probability current density vector, Bohr’s magneton	116
1.8.15. Solution 15 – The Schrödinger equation in the presence of a magnetic field, Zeeman–Lorentz triplet	119
1.8.16. Solution 16 – Deduction of the Schrödinger equation from De Broglie relation	122

Chapter 2. Hermitian Operator, Dirac's Notations	127
2.1. Orthonormal bases in the space of square-summable wave functions	129
2.1.1. Subspace of square-summable wave functions	129
2.1.2. Definition of discrete orthonormal bases	129
2.1.3. Component and norm of a wave function.	130
2.1.4. Closing relation	131
2.2. Space of states, Dirac's notations	132
2.2.1. Definition	132
2.2.2. Ket vector, bra vector	133
2.2.3. Properties of the scalar product.	134
2.2.4. Discrete orthonormal bases, ket component	134
2.3. Hermitian operators	135
2.3.1. Linear operator, matrix element	135
2.3.2. Projection operator on a ket and projection operator on a sub-space	136
2.3.3. Self-adjoint operator, Hermitian conjugation	139
2.3.4. Operator functions	140
2.4. Commutator algebra.	141
2.4.1. Poisson brackets	141
2.4.2. Commutation of operator functions	144
2.4.3. Trace of an operator	148
2.5. Exercises	149
2.5.1. Exercise 1 – Properties of commutators.	149
2.5.2. Exercise 2 – Trace of an operator	150
2.5.3. Exercise 3 – Function of operators.	150
2.5.4. Exercise 4 – Infinitesimal unitary operator.	151
2.5.5. Exercise 5 – Properties of Pauli matrices	151
2.5.6. Exercise 6 – Density operator.	152
2.5.7. Exercise 7 – Evolution operator	152
2.5.8. Exercise 8 – Orbital angular momentum operator.	153
2.6. Solutions	153
2.6.1. Solution 1 – Properties of commutators.	153
2.6.2. Solution 2 – Trace of an operator	157
2.6.3. Solution 3 – Function of operators.	159
2.6.4. Solution 4 – Infinitesimal unitary operator.	161
2.6.5. Solution 5 – Properties of Pauli matrices	163
2.6.6. Solution 6 – Density operator.	167
2.6.7. Solution 7 – Evolution operator	168
2.6.8. Solution 8 – Orbital angular momentum operator	172

Chapter 3. Eigenvalues and Eigenvectors of an Observable	175
3.1. Representation	176
3.1.1. Definition	176
3.1.2. Representation of kets and bras.	177
3.1.3. Representation of operators	177
3.1.4. Hermitian matrix	179
3.2. Eigenvalues equation, mean value	180
3.2.1. Definitions, degeneracy	180
3.2.2. Characteristic equation.	183
3.2.3. Properties of eigenvectors and eigenvalues of a Hermitian operator	186
3.2.4. Evolution of the mean value of an observable	187
3.2.5. Complete set of commuting observables	189
3.3. Conservative systems	189
3.3.1. Definition	189
3.3.2. Integration of the Schrödinger equation.	190
3.3.3. Ehrenfest's theorem	192
3.4. Exercises	194
3.4.1. Exercise 1 – Pauli matrices, eigenvalues and eigenvectors	194
3.4.2. Exercise 2 – Observables associated with the spin	194
3.4.3. Exercise 3 – Evolution of a 1/2 spin in a magnetic field: CSCO, Larmor precession	196
3.4.4. Exercise 4 – Eigenvalue of the squared angular momentum operator	197
3.4.5. Exercise 5 – Constant of motion, good quantum numbers.	198
3.4.6. Exercise 6 – Evolution of the mean values of the operators associated with position and linear momentum	198
3.4.7. Exercise 7 – Particle subjected to various potentials	199
3.4.8. Exercise 8 – Oscillating molecular dipole, root mean square deviation	199
3.4.9. Exercise 9 – Infinite potential well, time–energy uncertainty relation.	200
3.4.10. Exercise 10 – Study of a conservative system	202
3.4.11. Exercise 11 – Evolution of the density operator	203
3.4.12. Exercise 12 – Evolution of a 1/2 spin in a magnetic field	203
3.5. Solutions	205
3.5.1. Solution 1 – Pauli matrices, eigenvalues and eigenvectors	205
3.5.2. Solution 2 – Observables associated with the spin	208
3.5.3. Solution 3 – Evolution of a 1/2 spin in a magnetic field: CSCO, Larmor precession	212
3.5.4. Solution 4 – Eigenvalue of the square angular momentum operator	214

3.5.5. Solution 5 – Constant of motion, good quantum numbers	220
3.5.6. Solution 6 – Evolution of the mean values of the operators associated with position and linear momentum	221
3.5.7. Solution 7 – Particle subjected to various potentials	226
3.5.8. Solution 8 – Oscillating molecular dipole, root mean square deviation	228
3.5.9. Solution 9 – Infinite potential well, time–energy uncertainty relation.	233
3.5.10. Solution 10 – Study of a conservative system	242
3.5.11. Solution 11 – Evolution of the density operator	249
3.5.12. Solution 12 – Evolution of a 1/2 spin in a magnetic field	252
Appendix 1	257
Appendix 2	265
Appendix 3	269
