Foreword ix
Philippe EUDELINE

Preface xi
Abdelkhalak EL HAMI, David DELAUX and Henri GRZESKOWIAK

Chapter 1. Aggravated Testing 1
Henri GRZESKOWIAK, David DELAUX and Abdelkhalak EL HAMI

1.1. Introduction to aggravated (or highly accelerated) testing 1
1.2. Background 1
1.3. General approach 3
1.3.1. Robustness and reliability 5
1.4. Types of products affected by aggravated tests 8
1.5. Aeronautical sector example: effect of aging on the SOA (safe operating area) 13
1.6. Typology of precipitated defects in HALT tests 14
1.7. Carrying out tests with HALT machine's pneumatic hammers: inherent particularities and precautions 16
1.8. Comparing vibration fatigue of HALT versus ALT testing. 23
1.8.1. Presentation of the adopted approach 23
1.8.2. The fatigue damage spectrum. 24
1.8.3. Automotive case study: inverter/converter failure. 28
1.8.4. Comparison of accelerated and aggravated tests. 38
1.8.5. The standards 40
1.9. References 41

Chapter 2. Fatigue Damage Analysis and Reliability Optimization of Structures Subjected to Random Vibrations 47
Ahmed YAICH and Abdelkhalak EL HAMI

2.1. Introduction. 47
2.2. Fatigue damage analysis 48
2.2.1. Formulations and developments 48
2.2.2. Fatigue damage analysis strategy 51
2.3. Reliability optimization of structures subjected to random vibrations 52
2.3.1. Deterministic design optimization 52
2.3.2. Reliability-based design optimization 53
2.3.3. Reliability optimization of structures subjected to random vibrations 62
2.4. Applications 64
2.4.1. Description of the problem 64
2.4.2. Results and discussion 67
2.5. Conclusion 71
2.6. References 72

Chapter 3. Accelerated Testing 77
Henri GRZESKOWIAK, David DELAUX and Abdelkhalak EL HAMI

3.1. The different types of tests 77
3.1.1. The calculations 78
3.1.2. The simulations 78
3.1.3. The tests 79
3.1.4. Links between the three types of demonstrations 80
3.2. General information on accelerated testing 80
3.2.1. The experimental models 83
3.2.2. Statistical models 83
3.2.3. The physical models 83
3.3. The principle, methodology and implementation of accelerated testing 83
3.3.1. Definition and key concepts. 84
3.3.2. Evaluating the predictive reliability of a system by performing tests. 86
3.3.3. Accelerated tests (based on the physical model): example of temperature acceleration 88
3.3.4. Evaluating the predicted reliability of a system in relation to an imposed lifetime and environmental constraints 88

3.3.5. Humid heat. 90
3.3.6. Temperature 91
3.3.7. Multi-stress laws 92
3.3.8. Accelerated testing in practice 92
3.3.9. Reliability assessment for wear-and-tear related failure mechanisms. 93
3.3.10. Conclusion of section. 94
3.4. The different phases of building a reliability validation plan. 95
3.5. Development of a corrosion environment test for automotive heat exchangers 97
3.6. Accelerated testing standards 107
3.7. Conclusion 109
3.8. References 109

Chapter 4. Collection of Standards NF 50-144-1 to 6: The Consideration of Environment in the Product Lifecycle 113
Henri GRZESKOWIAK, David DELAUX and Abdelkhalak EL HAMI

4.1. Introduction. 113
4.2. Presentation of AFNOR NF 50-144-1 to 6 114
4.3. Focus on NF X50-144-3 119
4.3.1. The four steps of the methodology. 120
4.3.2. Focus on step 3: the DBM. 126
4.3.3. Focus on step 3: illustrations of the disjointed blocks method . . . 134
4.3.4. Example of test customization for the A400 M aircraft 140
4.5. References 143

Chapter 5. Development of Vibration Specifications for Powertrain Components 145
Marco BONATO

5.1. Introduction. 145
5.1.1. Combustion engine vibration 146
5.2. Types of vibration signals for validation testing 148
5.2.1. Conventional signals used in the automotive industry 148
5.2.2. Validation tests for engine mounted heat exchangers. 148
5.2.3. Recent developments: customizing vibration specifications. 149
5.2.4. The FFT method: test signal in PSD form and sinusoidal sweep . . 150
5.2.5. The customized test method. 151
5.3. Case study: vibratory specification for a water-cooled WCAC 153
5.3.1. Vibration signals: PSD and sinusoidal sweep 154

5.4. Development of a signal more representative of the real-world environment 156
5.4.1. Multi-sine sweeps over noise 157
5.4.2. Comparison with existing methods 159
5.4.3. Subsequent work 160
5.5. References 160

Chapter 6. Improving Accelerated Reliability Testing by Using Optimized Signals 163
Jonathan MARTINO

6.1. Introduction. 164
6.2. General considerations 165
6.2.1. Multi-sine signals. 166
6.3. Kurtosis and CF 170
6.3.1. Kurtosis. 170
6.3.2. Crest factor. 171
6.4. Optimization of multi-sine pseudo-random signals 172
6.4.1. Controlling the CF by optimizing the phase shifts 172
6.4.2. Preliminary treatment 173
6.4.3. Analytical determination 174
6.4.4. Numerical methods. 174
6.4.5. Stochastic distribution of signals with low CF. 175
6.4.6. Use of optimized low-peak signals for environmental testing. . . . 176
6.4.7. Kurtosis control through non-linear manipulation. 178
6.4.8. Duality between kurtosis and CF. 179
6.5. Damage assessment 182
6.5.1. Fatigue damage spectrum 182
6.5.2. Reducing the test duration. 186
6.5.3. Influence of signal optimization in damage assessment 186
6.6. Conclusion 192
6.7. References 193
