Foreword	xi
Part 1. Theory of Information	1
Introduction to Part 1	3
Chapter 1. Introduction to Telecommunications	5
1.1. Role of a communication system	5
1.1.1. Types of services offered by communication systems	6
1.1.2. Examples of telecommunications services	7
1.2. Principle of communication	7
1.3. Trend towards digital communications	10
Chapter 2. Measurement of Information of a Discrete Source and Channel Capacity	13
2.1. Introduction and definitions	13
2.2. Examples of discrete sources	14
2.2.1. Simple source (memoryless)	14
2.2.2. Discrete source with memory	14
2.2.3. Ergodic source: stationary source with finite memory	15
2.2.4. First order Markovian source (first order Markov chain)	15
2.3. Uncertainty, amount of information and entropy (Shannon's 1948 theorem).	16
2.3.1. Entropy of a source	18
2.3.2. Fundamental lemma	18
2.3.3. Properties of entropy	19
2.3.4. Examples of entropy	19

2.4. Information rate and redundancy of a source	20
2.5. Discrete channels and entropies	20
2.5.1. Conditional entropies	22
2.5.2. Relations between the various entropies	24
2.6. Mutual information	25
2.7. Capacity, redundancy and efficiency of a discrete channel	27
2.7.1. Shannon's theorem: capacity of a communication system	27
2.8. Entropies with k random variables	29
Chapter 3. Source Coding for Non-disturbance Channels	31
3.1. Introduction.	31
3.2. Interest of binary codes	31
3.3. Single decoding codes	32
3.3.1. Regular code.	33
3.3.2. Single-decoded code (decipherable or decodable code)	33
3.3.3. Instantaneous code (irreducible code).	34
3.3.4. Prefix	34
3.3.5. Design of an instantaneous binary code.	35
3.3.6. Kraft McMillan inequality	36
3.4. Average codeword length	36
3.4.1. Coding efficiency in terms of transmission speed.	36
3.4.2. Minimum average codeword length \overline{l}_{min}	37
3.5. Capacity, efficiency and redundancy of a code.	38
3.6. Absolute optimal codes.	38
3.7. K-order extension of a source	39
3.7.1. Entropy of the 2nd order extension of a source [S]	39
3.7.2. Simple example of the interest of coding a source extension	40
3.8. Shannon's first theorem	41
3.9. Design of optimal binary codes	42
3.9.1. Shannon–Fano coding	42
3.9.2. Huffman code	43
Chapter 4. Channel Coding for Disturbed Transmission Channels	47
4.1. Introduction.	47
4.2. Shannon's second theorem (1948)	48
4.3. Error correction strategies	48
4.4. Classification of error detection codes or error correction codes.	49
4.5. Definitions related to code performance	50
4.5.1. Efficiency	50

4.5.2. Weight of linear code or Hamming's weight	50
4.5.3. Hamming distance	51
4.6. Form of the decision	51
4.6.1. Maximum <i>a posteriori</i> likelihood decoding	52
4.7. Linear group codes	53
4.7.1. Decoding ball concept: Hamming's theorem.	54
4.7.2. Generating matrix [G] and test matrix [H]	55
4.7.3. Error detection and correction	58
4.7.4. Applications: Hamming codes ($r = 1$)	59
4.7.5. Coding and decoding circuits	62
4.7.6. Extension of Hamming codes.	63
4.7.7. Relationships between columns of the matrix [H']	64
4.8. Cyclic codes	65
4.8.1. Introduction	65
4.8.2. Expression of a circular permutation	67
4.8.3. Generating polynomial $g(x)$, generating matrix [G] and theorem of cyclic codes	68
4.8.4. Dual code generated by $h(x)$ and parity control matrix [H]	71
4.8.5. Construction of the codewords (coding)	72
4.9. Linear feedback shift register (LFSR) and its applications	83
4.9.1. Properties	84
4.9.2. Linear feedback shift register encoder and decoder (LFSR).	85
4.9.3. Coding by multiplication: non-systematic code	92
4.9.4. Detection of standard errors with cyclic codes.	95
4.9.5. Pseudo-random sequence generators: M-sequences, Gold, Kasami and Trivium	97
Part 2. Baseband Digital Transmissions and with Carrier Modulation.	117
Introduction to Part 2.	119
Chapter 5. Binary to M-ary Coding and M-ary to Signal Coding: On-line Codes	123
5.1. Presentation and typology	123
5.2. Criteria for choosing an on-line code.	125
5.3. Power spectral densities (PSD) of on-line codes	126
5.4. Description and spectral characterization of the main linear on-line codes with successive independent symbols	127
5.4.1. Binary NRZ code (non-return to zero): two-level code, two types of code.	128

5.4.2. NRZ M-ary code	131
5.4.3. Binary RZ code (return to zero)	132
5.4.4. Polar RZ on-line code	134
5.4.5. Binary biphas on-line code (Manchester code)	136
5.4.6. Binary biphas mark or differential code (Manchester mark code)	138
5.5. Description and spectral characterization of the main on-line non-linear and non-alphabetic codes with successive dependent symbols	139
5.5.1. Miller's code	140
5.5.2. Bipolar RZ code or AMI code (alternate marked inversion)	141
5.5.3. CMI code (code mark inversion)	144
5.5.4. HDB-n code (high density bipolar on-line code of order n)	145
5.6. Description and spectral characterization of partial response linear codes	147
5.6.1. Generation and interest of precoding	148
5.6.2. Structure of the coder and precoder	150
5.6.3. Power spectral density of partial response linear on-line codes	153
5.6.4. Most common partial response linear on-line codes	155
Chapter 6. Transmission of an M-ary Digital Signal on a Low-pass Channel	167
6.1. Introduction	167
6.2. Digital systems and standardization for high data rate transmissions	168
6.3. Modeling the transmission of an M-ary digital signal through the communication chain	170
6.3.1. Equivalent energy bandwidth Δf_e of a low-pass filter	174
6.4. Characterization of the intersymbol interference: eye pattern	175
6.4.1. Eye pattern	176
6.5. Probability of error P_e	179
6.5.1. Probability of error: case of binary symbols $a_k = \pm 1$	180
6.5.2. Probability of error: case of binary RZ code	185
6.5.3. Probability of error: general case of M-ary symbols	187
6.5.4. Probability of error: case of bipolar code	193
6.6. Conditions of absence of intersymbol interference: Nyquist criteria	196
6.6.1. Nyquist temporal criterion	196
6.6.2. Nyquist frequency criterion	196
6.6.3. Interpretation of the Nyquist frequency criterion	197

6.7. Optimal distribution of filtering between transmission and reception.	206
6.7.1. Expression of the minimum probability of error for a low-pass channel satisfying the Nyquist criterion.	211
6.8. Transmission with a partial response linear coder	212
6.8.1. Transmission using the duobinary code.	213
6.8.2. Transmission using 2nd order interleaved bipolar code	215
6.8.3. Reception of partial response linear codes	217
6.8.4. Probability of error P_e	220
Chapter 7. Digital Transmissions with Carrier Modulation	223
7.1. Introduction and schematic diagram of a digital radio transmission.	223
7.2. Multiple access techniques and most common standards	225
7.3. Structure of a radio link, a satellite link and a mobile radio channel.	230
7.3.1. Structure of a terrestrial link (one jump)	230
7.3.2. Structure of a satellite telecommunication link	230
7.3.3. Mobile radio channel.	231
7.4. Effects of multiple paths and non-linearities of power amplifiers	232
7.4.1. Effects of multiple paths: simple case of a direct path and only one delayed path.	232
7.4.2. Effects of non-linearities of power amplifiers	235
7.5. Linear digital carrier modulations.	237
7.5.1. Principle	237
7.5.2. General characteristics of the modulated signal $s(t)$	238
7.6. Quadrature digital linear modulations: general structure of the modulator, spatial diagram, constellation diagram and choice of a constellation	241
7.6.1. General structure of the modulator.	242
7.6.2. Spatial diagram (or vectorial) and constellation diagram	243
7.6.3. Choosing a constellation diagram	245
7.7. Digital radio transmission and equivalent baseband digital transmission: complex envelope	246
7.7.1. Equivalent baseband digital transmission: complex envelope	247
7.8. Equivalent baseband transmission, interest and justification: analytical signal and complex envelope.	251
7.8.1. Interest: important simplification in numerical simulation.	251

7.8.2. Analytical signal and complex envelope of a modulated signal	251
7.9. Relationship between band-pass filter H and equivalent low-pass filter H_e	253
7.9.1. Probability of errors	258
7.10. M-ary Phase Shift Keying Modulation (M-PSK)	258
7.10.1. Binary Phase Shift Keying (BPSK) modulation and demodulation.	259
7.10.2. Quaternary Phase Shift Keying (QPSK) modulation and demodulation.	262
7.10.3. Differential M-PSK receiver	267
7.10.4. Offset Quaternary Phase Shift Keying (OQPSK)	271
7.11. M-ary Quadrature Amplitude Modulation (M-QAM)	274
7.12. Detailed presentation of 16-QAM modulation and demodulation	275
7.12.1. Spectral occupancy of the 16-QAM modulated signal	277
7.13. Amplitude and Phase Shift Keying Modulation (APSK)	280
7.13.1. CIR (4, 4, 4, 4) modulation: 4 amplitudes, 4 phases (ITU-V29, 1980)	280
7.14. Detailed presentation of the 8-PSK modulation and demodulation	281
7.14.1. Differential coding and decoding of the 8-PSK modulation	284
7.14.2. Realization of the differential encoder and decoder: by Simulink simulation (MATLAB) and hardware implementation based on a ROM or EPROM memory	285
7.15. Performances of modulations in spectral occupancy and efficiency	291
