<b>Preface</b> . . . . .	ix
<b>Chapter 1. Introduction to a Universal Model: the Vlasov Equation</b> . . . . .	1
1.1. A historical point of view . . . . .	1
1.2. Individual and collective effects in plasmas . . . . .	5
1.3. Graininess parameter . . . . .	7
1.4. The collective description of a Coulomb gas: an intuitive approach . . . . .	8
1.5. From $N$ -body to Vlasov . . . . .	12
1.6. The graininess parameter and 1D, 2D or 3D models . . . . .	16
1.7. The Vlasov equation at the microscopic fluctuations level . . . . .	19
1.8. The Wigner equation (Vlasov equation for quantum systems) . . . . .	21
1.9. The relativistic Vlasov–Maxwell model . . . . .	26
1.10. References . . . . .	28
<b>Chapter 2. A Paradigm for a Collective Description of a Plasma: the 1D Vlasov–Poisson Equations</b> . . . . .	31
2.1. Introduction . . . . .	31
2.2. The linear Landau problem . . . . .	33
2.2.1. The Maxwellian case . . . . .	34
2.2.2. Landau poles and others . . . . .	36
2.2.3. Unstable plasma: two-stream instability . . . . .	38
2.3. The 1D cold plasma model: nonlinear oscillations . . . . .	39
2.3.1. Hydrodynamic description . . . . .	39
2.3.2. Lagrangian formulation through the Von Mises transformation . . . . .	40

2.3.3. The wave-breaking phenomenon . . . . .	42
2.4. The water bag model . . . . .	44
2.4.1. Basic equations . . . . .	44
2.4.2. Linearized theory . . . . .	47
2.4.3. Water bag hydrodynamic description . . . . .	48
2.5. Connection between the hydrodynamic, water bag and Vlasov models . . . . .	50
2.5.1. A Vlasov hydrodynamic description . . . . .	50
2.5.2. Vlasov numerical simulations of $Pn^{-3}$ . . . . .	52
2.5.3. The fundamental contribution of poles besides Landau . . . . .	56
2.6. The multiple water bag model . . . . .	58
2.6.1. A multifluid description . . . . .	59
2.6.2. Linearized analysis . . . . .	63
2.7. Further remarks . . . . .	66
2.8. References . . . . .	71
<b>Chapter 3. Electromagnetic Fields in Vlasov Plasmas: General Approach to Small Amplitude Perturbations . . . . .</b>	<b>75</b>
3.1. Introduction and overview of the chapter . . . . .	75
3.2. Linear analysis of the Vlasov–Maxwell system: general approach . . . . .	77
3.2.1. Dispersion relation and response matrix . . . . .	81
3.2.2. The choice of the basis for the response tensor . . . . .	83
3.2.3. About the number of “waves” in plasmas . . . . .	89
3.2.4. Real or complex values of $k$ and $\omega$ : steady state and initial value problems . . . . .	92
3.3. Polynomial approximations of the dispersion relation: why and how to use them . . . . .	93
3.3.1. Truncated-Vlasov and fluid–plasma descriptions for the linear analysis . . . . .	96
3.3.2. Wave dispersion and resonances allowed by inclusion of high-order moments in fluid models . . . . .	99
3.3.3. An example: fluid moments and Finite–Larmor–Radius effects . . . . .	103
3.3.4. Key points about approximated normal mode analysis . . . . .	108
3.4. Vlasov plasmas as collisionless conductors with polarization and finite conductivity: meaning of plasma’s “dielectric tensor” . . . . .	109
3.4.1. Polarization charges and wave equation in dielectric materials . . . . .	112
3.4.2. The “equivalent” dielectric tensor and its complex components . . . . .	115

3.4.3. Temporal and spatial dispersion in plasmas . . . . .	120
3.4.4. Conductivity and collisional resistivity in Vlasov plasmas . . . . .	122
3.5. Symmetry properties of the complex components of the equivalent dielectric tensor and energy conservation . . . . .	126
3.5.1. Onsager's relations . . . . .	126
3.5.2. Poynting's theorem . . . . .	129
3.5.3. Symmetry of the coefficients of the equivalent dielectric tensor . . . . .	130
3.5.4. More about Onsager's relations for wave dispersion . . . . .	134
3.5.5. Energy dissipation versus real and imaginary parts of $\sigma_{ij}$ and $\epsilon_{ij}$ . . . . .	138
3.6. References . . . . .	141

**Chapter 4. Electromagnetic Fields in Vlasov Plasmas:  
Characterization of Linear Modes . . . . . 147**

4.1. Introduction . . . . .	147
4.2. Characterization of electromagnetic waves and of wave-packets . . . . .	148
4.2.1. Polarization of electromagnetic waves in plasmas . . . . .	153
4.2.2. Phase velocity, group velocity and refractive index . . . . .	156
4.2.3. Example of propagation in unmagnetized plasmas: underdense and overdense regimes . . . . .	161
4.2.4. Example of propagation in magnetized plasmas: ion-cyclotron resonances and Faraday's rotation effect . . . . .	166
4.2.5. Wave-particle resonances, Landau damping and wave absorption . . . . .	172
4.2.6. Resonance and cut-off conditions on the refractive index . . . . .	176
4.2.7. Graphical representations of the dispersion relation . . . . .	178
4.3. Instabilities in Vlasov plasmas: some terminology and general features . . . . .	182
4.3.1. Linear instabilities . . . . .	184
4.3.2. Absolute and convective instabilities and some other classification criteria . . . . .	192
4.4. On some complementary interpretations of the collisionless damping mechanism in Vlasov plasmas . . . . .	198
4.4.1. Landau damping as an inverse Vavilov-Cherenkov radiation . . . . .	199
4.4.2. Landau damping in $N$ -body "exact" models . . . . .	203

4.4.3. Some final remarks about interpretative issues of collisionless damping in Vlasov mean field theory . . . . .	206
4.5. References . . . . .	207

**Chapter 5. Nonlinear Properties of Electrostatic Vlasov Plasmas** . . . . . 215

5.1. The Vlasov–Poisson system . . . . .	215
5.2. Invariants of the Vlasov–Poisson model . . . . .	216
5.3. Stationary solutions: Bernstein–Greene–Kruskal equilibria . . . . .	217
5.4. Some mathematical properties of the Vlasov equation . . . . .	220
5.5. The Bernstein–Greene–Kruskal solutions . . . . .	229
5.5.1. The case of (electrostatic) two-stream instability . . . . .	230
5.5.2. Chain of BGK equilibria . . . . .	235
5.5.3. Stability of the periodic BGK steady states . . . . .	236
5.6. Traveling waves of BGK-type solutions . . . . .	242
5.7. Role of minority population of trapped particles . . . . .	245
5.7.1. Nonlinear Landau damping and the emergence of the nonlinear Langmuir-type wave . . . . .	247
5.7.2. Electron acoustic wave in the nonlinear Landau damping regime . . . . .	254
5.7.3. Kinetic electrostatic electron nonlinear waves . . . . .	260
5.7.4. Emergent resonance for KEEN waves . . . . .	268
5.8. Nature of KEEN waves and NMI . . . . .	270
5.8.1. Adiabatic model for a single linear wave: the (electrostatic) trapped electron mode model . . . . .	270
5.8.2. The Dodin and Fisch model connected to the emergence of KEEN waves . . . . .	274
5.9. Electron hole and plasma wave interaction . . . . .	281
5.10. References . . . . .	291
