Foreword	ix
Preface	xi
List of Notations	xv
Chapter 1. The Industrial Revolution 4.0	1
1.1. A history of industrial revolutions	1
1.2. Defining the factory of the future	3
1.3. Technology used in Industry 4.0	3
1.3.1. Disruptive technology	4
1.3.2. Technologies used for communication and interconnection	5
1.3.3. Data management technology	7
1.4. Attempts at structuring technologies	11
1.5. Conclusion	14
Chapter 2. The Concept of Safety 4.0	15
2.1. Context and definition	15
2.2. The history of the evolution of safety	16
2.3. Safety framework	18
Chapter 3. Occupational Safety and Health	21
3.1. Impact of Industry 4.0 work conditions	21
3.2. Definitions	23
3.3. OSH versus process safety	23
3.4. OSH assessment of occupational hazards	24
3.4.1. Regulations, norms and unique document	24

3.4.2. Inventory of risk analysis techniques and methods	30
3.4.3. Applicability of risk analysis methods to OSH	32
Chapter 4. Process Safety and Cybersecurity	39
4.1. Reviewing risk analysis methods in process safety: example of the bow-tie method	39
4.2. Risk-evaluation matrix in process safety	42
4.3. Risk analysis methods for industrial information systems: example of the EBIOS and attack tree method	45
4.4. Cybersecurity risk-assessment matrix	49
4.5. Coordinating risk analysis methods	51
4.6. Reconciling process safety and cybersecurity methods	53
4.6.1. Preliminary risk analysis and preliminary cyber-risk analysis	53
4.6.2. HAZOP, CHAZOP and Cyber HAZOP methods	54
4.6.3. Bow-tie graph and cyber bow-tie	58
4.6.4. LOPA and Cyber LOPA methods	58
4.6.5. The integrated, simultaneous ATBT method	62
4.7. Concatenation of matrices	64
4.8. Reasoned use of risk matrices	66
Chapter 5. Examples: Safety 4.0 and Processes	71
5.1. Distillation column control	71
5.2. Attempt to classify the applications of a digital twin in the field of Safety 4.0	72
5.2.1. Potential of a digital twin for Safety 4.0	73
5.2.2. Proposal for a classification framework	73
5.3. Modernization of a pilot installation of an ejector pump	75
5.4. Model for developing a digital twin to prevent OSH in the process industry	77
5.4.1. Description of the model	79
5.4.2. Implementing the model	80
5.4.3. Conclusion	81
5.5. Custom manufacture of food product by project development	81
5.6. Impact of the design of a cyberphysical system on an industrial process	83
5.6.1. Choosing the problem to be studied	84
5.6.2. Design principle for the cyberphysical system	85
5.7. Principle for redesigning a process in a cyberphysical production system	87
5.8. Systematic integrated approach to improve the processing of contaminated sediments	91

5.8.1. The Novosol® process	91
5.8.2. The sociotechnical Novosol® system	92
5.8.3. Conclusion	92
5.9. Digitalization to benefit safety management	92
5.9.1. Improvement in the quality of technical risk assessment and modeling the impact of cumulative risks	95
5.9.2. Providing a real-time view of the actual state of critical equipment and their impact on the risks	96
5.10. Detection of deviations in the functioning of a heat exchanger through an artificial neural network	97
5.11. RFID applied to the prevention of occupational hazards	99
5.11.1. Fields of application of RFID technology	100
5.11.2. RFID applied to occupational safety and health	100
5.12. How RFID contributes to industrial engineering safety	102
5.13. Exploring the idea of a socially safe and sustainable workplace for an Operator 4.0	102
5.14. Industry 4.0 challenges related to safety and the environment in the leather industry	105
5.15. Safety 4.0: metrics and performance indicators	107
5.15.1. Impact or lagging indicator	108
5.15.2. Activity or leading indicator	109
5.15.3. Some recommended examples of performance indicators for process safety	109
5.15.4. Examples of the application of safety performance indicators . . .	112
Chapter 6. Intensification and Inherent Safety: Myth or Reality? . .	117
6.1. A review of essential elements in process intensification	117
6.2. Some examples of process intensification	119
6.2.1. The reduction principle in support of the risk management	119
6.2.2. Areas of interest for using microstructured reactors	122
6.2.3. Transposition of an exothermic reaction in an intensified, continuous heat exchanger	124
6.2.4. Pilot demonstration of IMPULSE for the production of sulfur trioxide through the oxidation of sulfur dioxide by air	126
6.2.5. Synthesis of ionic liquids by alkylation in a microstructured reactor	128
6.2.6. Developing an intensified process for the industrial synthesis of methanol from carbon dioxide	129
6.2.7. Feasibility of intensifying the production of vinyl acetate monomer	131

6.2.8. The microstructured reactor with catalytic walls: accelerator of the performance of a conventional tubular reactor	133
6.2.9. Generic example of direct gaseous fluorination of a liquid hydrocarbon	135
6.3. An attempt to rationalize intensification equipment	138
6.4. Concept and application of a general methodological framework for the synthesis and design of processes that integrate intensification	141
6.5. Reality or myth? Safety 4.0 in intensification processes	143
6.5.1. A few assessment tools	144
6.5.2. Examples of safety versus intensification conflicts	152
6.5.3. Vigilance when putting into practice the risk analysis methods based on the use of digital data	162
Conclusion	165
