Introduction	xiii
PART I. REPRESENTING DECISION-MAKING PROBLEMS IN THE PFU FRAMEWORK	1
Chapter 1. Background Notation and Definitions	3
1.1. Basic definitions	3
1.2. An illustrative example	7
1.2.1. Adding uncertainties	7
1.2.2. Adding feasibilities	9
Chapter 2. A Guided Tour of Frameworks for Decision-Making	11
2.1. SAT-based decision frameworks	12
2.1.1. The satisfiability problem	12
2.1.2. Quantified Boolean formulas: towards pessimistic indeterminism and partial observabilities	13
2.1.3. Stochastic SAT and extended stochastic SAT: towards a stochastic indeterminism	14
2.2. CSP-based decision frameworks	15
2.2.1. Constraint satisfaction problems	15
2.2.2. Extension to non-binary uncertainties and utilities: soft constraints	17
2.2.2.1. Valued CSP	17
2.2.2.2. Semiring-based CSP	18
2.2.3. Modeling uncontrollabilities and partial observabilities: mixed CSP	20

2.2.4. Quantified CSP for modeling multi-step decision processes	22
2.2.5. Integrating probabilistic uncertainties: stochastic CSP	23
2.3. Bayesian network-based decision frameworks	25
2.3.1. Bayesian networks	25
2.3.2. Possibilistic networks	27
2.3.3. Mixed networks	28
2.3.4. Influence diagrams	29
2.4. Beyond conditional probabilities for modeling uncertainties	32
2.4.1. Markov random fields and chain graphs	32
2.4.2. Valuation networks	34
2.5. Classical planning-based frameworks	36
2.5.1. Classical planning	36
2.5.2. Conformant planning and probabilistic planning	40
2.6. Sequential decision-making under uncertainty with MDPs	40
2.6.1. Markov decision processes	41
2.6.2. Partially observable MDPs	44
2.6.3. Other uncertainty–utility models: towards algebraic MDPs	45
2.6.4. Back to a variable-based representation: factored MDPs	46
2.7. Valuation algebras	48
2.8. The three basic ingredients of a generic framework for sequential decision-making with uncertainties, feasibilities and utilities	50
2.9. Summary	52
Chapter 3. A Generic Algebraic Structure for Sequential Decision-Making Under Uncertainty	53
3.1. Some algebraic definitions	53
3.2. Plausibility structure	54
3.2.1. Friedman–Halpern’s structure	54
3.2.2. Restriction of Friedman–Halpern’s structure	55
3.2.3. From plausibility measures to plausibility distributions	56
3.3. Feasibility structure	57
3.4. Utility structure	57
3.5. Expected utility structure	59
3.5.1. Chu–Halpern’s structure	59
3.5.2. Adapting Chu–Halpern’s structure for sequential decision-making	60
3.6. Structures covered	61
3.7. Relations with other existing structures	62
3.8. Summary	63
Chapter 4. Plausibility–Feasibility–Utility Networks	65
4.1. Decision and environment variables	65
4.2. Towards local plausibility and feasibility functions	66

4.2.1. A first factorization step using conditional independence	66
4.2.1.1. Preliminaries: generalization of Bayesian networks results .	66
4.2.1.2. Taking the different types of variables into account	71
4.2.2. Further factorization steps	73
4.3. Local utilities	75
4.4. Formal definition of PFU networks	76
4.5. From PFU networks to global functions	77
4.6. Back to existing frameworks	77
4.7. Summary	79
Chapter 5. Queries on a PFU Network	81
5.1. Query definition	82
5.2. Answer to a query: a semantic definition based on decision trees .	83
5.2.1. Decision tree procedure: an example	84
5.2.2. Formalization of the decision tree procedure	85
5.3. Answer to a query: a second more operational definition	88
5.4. Equivalence theorem	89
5.5. Bounded queries	89
5.6. Back to existing frameworks	90
5.7. Extensions to other classes of queries	91
5.8. Summary	92
5.9. Conclusion of Part I: gains and costs of the PFU framework	93
5.9.1. A better understanding	93
5.9.2. Increased expressive power	93
5.9.3. Generic algorithms	94
PART II. GENERIC ALGORITHMS FOR ANSWERING PFU QUERIES	97
Chapter 6. First Generic Algorithms	99
6.1. A basic tree search algorithm	100
6.2. A first naive variable elimination algorithm	101
6.3. Improving the basic scheme	101
6.4. Solving the undecomposability problem via two distinct sufficient conditions	104
6.5. Definition of an improved variable elimination algorithm	106
6.5.1. Improved VE algorithm in the semiring case	106
6.5.2. Improved VE algorithm in the semigroup case	108
6.5.3. General case	111
6.5.4. Simplifying the problem specification in the semigroup case .	113
6.6. Quantifying the theoretical complexity via the constrained induced width	115

6.6.1. Induced width	116
6.6.2. Constrained induced width	119
6.7. Decreasing the constrained induced width	120
6.7.1. Weakening constraints on the elimination order	120
6.7.2. Working on the hypergraph	122
6.8. Summary	124
Chapter 7. Structuring Multi-operator Queries	127
7.1. Back on the multi-operator queries considered	127
7.2. From queries to computation nodes	128
7.2.1. Towards a two-step structuration process	130
7.3. Structuring multi-operator queries in the semiring case	131
7.3.1. Building the macrostructure of a query using rewriting rules	131
7.3.1.1. Decomposition and recombination rules	131
7.3.1.2. Using normalization conditions	134
7.3.1.3. Some good properties of the final macrostructure obtained .	136
7.3.2. Preliminaries: cluster-tree decompositions	139
7.3.3. Towards multi-operator cluster trees using cluster-tree	
decompositions	143
7.3.4. Comparison with an unstructured approach	145
7.3.5. Comparison with existing approaches	146
7.3.6. Adding feasibilities	147
7.4. Structuring multi-operator queries in the semigroup case	147
7.4.1. Building the macrostructure of a query using rewriting rules	148
7.4.1.1. Rewriting rules for \oplus_x	149
7.4.1.2. Rewriting rules for \max_x	151
7.4.1.3. Some good properties of the macrostructure obtained	154
7.4.1.4. Complexity results	156
7.4.2. Cluster-tree decompositions to structure DAGs of computation	
nodes: towards multi-operator cluster-DAGs (MCDAGs)	156
7.4.2.1. Decreasing the MCDAG width	157
7.4.2.2. Merging some computations	161
7.4.3. Comparison with an unstructured approach	163
7.4.4. Comparison with existing approaches	163
7.4.5. Adding feasibilities	164
7.5. Conclusion: a generic computational architecture, the MCDAG	
architecture	165
Chapter 8. A Generic Structured Tree Search on the	
MCDAG Architecture	167
8.1. Existing structured tree search algorithms	168
8.1.1. AND/OR search spaces	168
8.1.2. Recursive conditioning	169

8.1.3. The BTD algorithm	170
8.1.4. From existing works to a generic structured tree search on MCDAGs	171
8.2. A first generic structured tree search	171
8.3. Adding caching to the structured tree search	173
8.4. A structured tree search using both bounds and caching	175
8.4.1. A small additional algebraic assumption	175
8.4.2. Using bounds in presence of several elimination operators	176
8.4.3. Using bounds without inverse for the combination operations	178
8.4.4. Algorithm definition	179
8.4.5. Soundness and completeness of algorithm BTD-mcdag	185
8.5. Using division and difference operators	186
8.6. Calculating bounds by inference mechanisms	192
8.6.1. Calculating bounds by propagation	193
8.6.2. Calculating bounds by switching quantifiers	194
8.6.3. Calculating bounds by relaxing quantifiers	194
8.6.4. Calculating bounds with mini-buckets	196
8.6.5. Calculating bounds by simplifying the algebraic structure	196
8.7. Integrating feasibilities	197
8.8. Summary and perspectives	197
Chapter 9. A Generic Solver for Answering PFU Queries	199
9.1. Description of problems	199
9.1.1. XML representation of PFU networks	199
9.1.2. XML representation of queries	202
9.1.3. Reading other formats	203
9.2. Solver description	203
9.2.1. PFU networks and queries	203
9.2.2. Readers	205
9.2.3. Algebraic structure	206
9.2.4. Solver	206
9.3. Perspectives	207
Chapter 10. Conclusion	209
10.1. Synthesis of the contributions	209
10.2. Perspectives	210
APPENDICES	213
Appendix A. Notation	215

Appendix B. Proofs	217
B.1. Proofs of Chapter 3	217
B.2. Proofs of Chapter 4	217
B.3. Proofs of Chapter 5	223
B.4. Proofs of Chapter 6	239
B.5. Proofs of Chapter 7	250
B.6. Proofs of Chapter 8	285
Appendix C. Concrete problem example: deployment and maintenance of a constellation of satellites	303
C.1. Problem description	303
C.2. PFU formulation	305
C.3. Algebraic structure	306
C.4. Variables	306
C.5. Feasibility functions	307
C.6. Plausibility (probability) functions	307
C.7. Utility (cost) functions	308
C.8. Query	310
Appendix D. DTD (Document Type Definition) of the XML format	311
Bibliography	313
Index	323
