

Table of Contents

Introduction. Introduction to Energy Autonomous Micro and Nano Systems and Presentation of Contributions	xiii
Marc BELLEVILLE and Cyril CONDEMINÉ	
I.1. Context of energy-autonomous systems and micro-nanosystems.	xiii
I.2. Sample applications.	xvi
I.3. Energy harvesting, storage and conversion	xvii
I.4. Data acquisition, processing and transmission	xviii
I.5. Energy management	xix
I.6. Bibliography	xx
Chapter 1. Sensors at the Core of Building Control	1
Gilles CHABANIS, Laurent CHIESI, Hynek RAISIGEL, Isabelle RESSEJAC and Véronique BOUTIN	
1.1. Introduction	1
1.2. Sensors in buildings	2
1.3. New sensor needs.	3
1.3.1. Perceived comfort and air quality	3
1.3.2. Sensors in buildings: toward new needs	8
1.4. An example: the HOMES comfort sensor prototype	10
1.4.1. Sensitive parts: the measurement	11
1.4.2. Communication and network operation	11
1.4.3. Energy recovery	14
1.4.4. Energy storage and management.	15

1.4.5. Autonomous HOMES multi-sensor performances	17
1.5. Conclusion	20
1.6. Bibliography	21
Chapter 2. Toward Energy Autonomous Medical Implants	23
Raymond CAMPAGNOLO and Daniel KROISS	
2.1. Introduction	23
2.2. Current and potential applications	24
2.2.1. Heart stimulation	25
2.2.2. Implantable cardioverter-defibrillator	37
2.2.3. Implantable cardiac monitor	40
2.2.4. Implantable neurostimulator	42
2.2.5. Implantable vagus nerve stimulator.	44
2.2.6. Implantable sacral nerve stimulator.	47
2.2.7. Implantable spinal cord stimulator	48
2.2.8. Cochlear implant	49
2.2.9. Implantable pumps	52
2.3. Conclusion	55
2.4. Bibliography	57
Chapter 3. Energy Autonomous Systems in Aeronautic Applications	59
Thomas BECKER, Jirka KLAUE and Martin KLUGE	
3.1. Motivation	59
3.1.1. Future applications for energy autonomous systems in aeronautics.	60
3.2. Wireless systems	62
3.2.1. Medium access schemes.	62
3.2.2. Wireless sensor network standards	63
3.2.3. Available hardware for wireless sensor networks	64
3.2.4. Energy consumption limitations.	65
3.2.5. Network architecture	66
3.3. Autonomous systems	71
3.3.1. Targeting a maintenance-free operation	71
3.3.2. Energy harvesting in aeronautic environments.	71
3.4. Summary	79
3.5. Bibliography	79

Chapter 4. Energy Harvesting by Photovoltaic Effect	83
Emmanuelle ROUVIÈRE, Simon PERRAUD, Cyril CONDEMINÉ and Guy WALTISPERGER	
4.1. Introduction	83
4.2. Light power available indoors and outdoors	84
4.2.1. Irradiance and illuminance	84
4.2.2. Light power available outdoors.	85
4.2.3. Light power available indoors	86
4.2.4. Summary.	87
4.3. Photovoltaic cell: physical principle and model.	88
4.3.1. Physical principle	88
4.3.2. Current–voltage characteristics.	89
4.3.3. Model.	91
4.4. Comparison between various photovoltaic cell technologies	96
4.5. Electronic management	97
4.5.1. Cell uses and limitations	99
4.5.2. The various possible MPPT solutions.	101
4.5.3. Applying MPPT to autonomous microsystems	107
4.6. Conclusion	110
4.7. Bibliography	110
 Chapter 5. Mechanical Energy Harvesting	 115
Ghislain DESPESE, Jean Jacques CHAILLOUT, Sébastien BOISSEAU and Claire JEAN-MISTRAL	
5.1. Energy-harvesting analysis	115
5.2. Main sources and conversion principles of mechanical energy	116
5.2.1. Sources	116
5.2.2. Exploitable physical principles	117
5.3. Harvesting mechanical energy from vibrations	122
5.3.1. Mechanical model	122
5.3.2. Piezoelectric structures	124
5.3.3. Electromagnetic structures.	127
5.3.4. Electrostatic structures	130
5.3.5. Improving electrostatic systems: hybrid devices	132
5.3.6. Conclusions and perspectives on vibration energy harvesting	137
5.4. Mechanical energy harvesting from forces/deformations	138

5.4.1. Definition and classification of electroactive polymers	139
5.4.2. Current conclusions and future developments	141
5.5. Conclusions and perspectives on mechanical energy harvesting	142
5.6. Bibliography	142
Chapter 6. Thermal Energy Harvesting.	153
Tristan CAROFF, Emmanuelle ROUVIÈRE and Jérôme WILLEMEN	
6.1. General presentation.	153
6.2. Energy harvesting by thermoelectric effect	154
6.2.1. Physical principle of the Seebeck effect	154
6.2.2. Energetic efficiency of a thermoelectric device	154
6.2.3. Maximum electric energy harvested by a thermogenerator	159
6.3. Thermoelectric materials.	160
6.4. Technological trends	162
6.4.1. Evolution of thermoelectric materials	162
6.4.2. Producing thermoelectric module for energy harvesting	164
6.4.3. Examples of microsystems used to harvest thermal energy	166
6.5. Implementation constraints and optimization	167
6.5.1. Thermal constraints.	167
6.5.2. Electric constraints	168
6.5.3. Optimizing TEG geometry for autonomous devices	168
6.6. Electronic management of autonomous thermoelectric systems	172
6.6.1. Step-up converters	174
6.6.2. Maximum energy extraction: the need for an adaptation of the DC/DC converter	181
6.7. Conclusions on thermal energy-harvesting systems	182
6.8. Bibliography	183
Chapter 7. Lithium Micro-Batteries	185
Raphaël SALOT	
7.1. Development of lithium batteries over 20 years	186
7.1.1. Alternative materials for the positive electrode	188
7.1.2. Alternative materials for the negative electrode	190

7.1.3. Alternative materials for the electrolyte	190
7.1.4. Positioning of different categories	191
7.2. The lithium system aiming for strong miniaturization properties	191
7.2.1. Lithium mini-batteries	193
7.2.2. Lithium micro-batteries	195
7.3. Bibliography	204
Chapter 8. Ultra-Low-Power Sensors.	207
Pascal NOUET, Norbert DUMAS, Laurent LATORRE and Frédéric MAILLY	
8.1. Introduction	207
8.2. Overview of sensors and their proximity electronics.	208
8.2.1. Power consumption of passive sensors	208
8.2.2. Intrinsic resolution of a resistive sensor	210
8.2.3. Intrinsic resolution of a capacitive sensor	210
8.2.4. Comparative study of different transduction modes	211
8.2.5. Front-end electronics performance criteria	212
8.3. Capacitive sensors	213
8.3.1. General considerations about capacitive sensors	213
8.3.2. Continuous-time interfaces	214
8.3.3. Discrete-time interfaces	220
8.4. Resistive sensors	232
8.5. Conclusions	236
8.6. Bibliography	237
Chapter 9. Ultra-Low-Power Signal Processing in Autonomous Systems	241
Christian PIGUET	
9.1. Low-power consumption	242
9.2. Digital signal processors	245
9.2.1. Digital signal processors	246
9.2.2. Why DSP are different	247
9.2.3. Low-power DSPs	249
9.3. Decreasing static power consumption	254
9.3.1. Decreasing static power consumption at the circuit level	254
9.3.2. Decreasing static power consumption at the logic gate level	256

9.3.3. Reduction in static consumption at the architecture level	256
9.3.4. Subthreshold logic	259
9.4. Asynchronous architectures	260
9.5. Error tolerance	264
9.5.1. Error detection	264
9.5.2. Probabilistic CMOS logic	265
9.6. Conclusion	266
9.7. Bibliography	267

Chapter 10. Ultra-Low-Power Radio Frequency Communications and Protocols 273

Eric MERCIER

10.1. Introduction	273
10.2. Radio frequency and associated restrictions	274
10.3. Communication standards and protocols	279
10.3.1. Home automation network	282
10.3.2. Body area network (BAN)	286
10.3.3. Hybrid networks and future solutions	287
10.4. Components and solutions	289
10.4.1. Available off-the-shelf solutions	290
10.4.2. Advanced solutions – research topics	293
10.5. Conclusion	297
10.6. Bibliography	298

Chapter 11. Energy Management in an Autonomous Microsystem 301

Jean-Frédéric CHRISTMANN, Edith BEIGNE, Cyril CONDEMINÉ, Jérôme WILLEMIN and Christian FIGUET

11.1. Wireless sensor nodes	303
11.2. Power supplied by energy recuperators	306
11.3. Distribution, conversion and energy storage architectures	308
11.3.1. Basic architectures: toward the serial architecture	308
11.3.2. Advanced architectures: parallelization of power paths	311
11.4. Implementing regulators	314
11.5. Algorithms	317

11.6. Conclusion	322
11.7. Bibliography	322
Chapter 12. Optimizing Energy Efficiency of Sensor Networks	325
Olivier SENTIEYS and Olivier BERDER	
12.1. Introduction.	325
12.2. Optimization methodology	328
12.3. Energy consumption model.	329
12.4. Hardware optimization.	332
12.4.1. Architecture of a sensor node	332
12.4.2. PowWow platform.	333
12.4.3. Using a reconfigurable coprocessor	335
12.4.4. Dynamic management of voltage and frequency	336
12.4.5. Reducing consumption by power gating and specialization	337
12.5. Software organization and efficient protocols	343
12.5.1. Minimalist operating systems	343
12.5.2. Medium access protocols.	345
12.6. Optimizing energy of algorithms	346
12.6.1. Adaptation to the wake-up interval	346
12.6.2. Using error correcting codes.	348
12.6.3. Cooperative strategies.	349
12.7. Conclusion and perspectives	354
12.8. Bibliography	355
List of Authors	361
Index	365
