Chapter 1. Introduction to Arbitrary Lagrangian–Eulerian in Finite Element Methods	1
David J. BENSON	
1.1. Introduction	1
1.2. Governing equations	3
1.3. Operator splitting	4
1.4. The Lagrangian step	7
1.4.1. Governing equations	7
1.4.2. The central difference method	8
1.4.3. Element formulation	11
1.4.4. Hourglass modes	14
1.4.5. Stress rates	16
1.4.6. Shock viscosity	18
1.4.6.1. von Neumann–Richtmyer	19
1.4.6.2. Standard quadratic and linear formulation	20
1.4.6.3. Effect on time step size	21
1.4.7. Mixture theories	22
1.4.7.1. Mean strain rate mixture theory	22
1.4.7.2. Mean stress mixture theory	24
1.5. Mesh relaxation	25

1.6. The Eulerian step	27
1.6.1. Transport in one dimension	29
1.6.2. Multidimensional transport by operator splitting	32
1.6.3. Multidimensional transport on unstructured meshes	34
1.6.4. Momentum transport	35
1.6.4.1. Momentum transport using a dual mesh in one dimension	36
1.6.4.2. Element-centered transport in one dimension	37
1.6.5. Interface reconstruction	39
1.6.5.1. Lagrangian methods	40
1.6.5.2. Level set methods	41
1.6.5.3. Volume of fluid methods	42
1.7. Future research directions	44
1.8. Bibliography	45
Chapter 2. Fluid–Structure Interaction: Application to Dynamic Problems	51
Mhamed SOULI	
2.1. Introduction	51
2.2. General ALE description of Navier–Stokes equations	54
2.3. Fluid–structure interaction	57
2.3.1. Contact algorithms for fluid–structure interaction problems	59
2.3.2. Euler–Lagrange coupling	62
2.3.3. Damping in the coupling	69
2.4. Numerical applications	72
2.4.1. Piston problem	72
2.4.2. Two-dimensional slamming modeling	74
2.4.2.1. Numerical approach of a two-dimensional slamming problem	76
2.4.2.2. Numerical approach for rigid structure	76
2.4.3. Airbag deployment	81
2.4.4. Sloshing tank problem	84

2.4.4.1. Analytical treatment of the sloshing problem	87
2.4.4.2. Sloshing in a rigid tank	89
2.4.4.3. Frequency analysis for sloshing	96
2.4.4.4. Application to a cylindrical flexible tank subjected to seismic loading	100
2.5. Conclusion	104
2.6. Acknowledgments	104
2.7. Bibliography	105
Chapter 3. Implicit Partitioned Coupling in Fluid–Structure Interaction	109
Michael SCHÄFER	
3.1. Introduction	109
3.2. Computational fluid mechanics	110
3.2.1. Governing equations	111
3.2.1.1. Incompressible flows	112
3.2.1.2. Inviscid flows	114
3.2.2. Finite volume discretization	115
3.2.2.1. Solution algorithms	117
3.3. Computational structural mechanics	121
3.3.1. Governing equations	121
3.3.1.1. Linear elasticity	122
3.3.1.2. Plane stress problems	126
3.3.1.3. Hyperelasticity	128
3.3.2. Finite element methods	129
3.4. Fluid–structure interaction algorithms	136
3.4.1. ALE formulation	137
3.4.2. Mesh dynamics	138
3.4.2.1. Algebraic approaches	139
3.4.2.2. Elliptic approaches	141
3.4.3. Coupling methods	146
3.4.3.1. Implicit partitioned coupling	147
3.5. Results and applications	150
3.5.1. Verification results	150
3.5.2. Validation results	151
3.5.3. Flow induced by solid deformation	155

3.5.4. Interaction of flow and solid deformation . . .	157
3.6. Bibliography	161
Chapter 4. Avoiding Instabilities Caused by Added Mass Effects in Fluid–Structure Interaction Problems	165
Sergio IDELSOHN, Facundo DEL PIN and Riccardo ROSSI	
4.1. Introduction	165
4.2. The discretized equations to be solved in a FSI problem	169
4.3. Monolithic solution of the FSI equations by pressure segregation	174
4.4. Static condensation of the pressure	176
4.4.1. Approximation to the static condensation	178
4.4.2. Definition of the stabilizing matrix	182
4.5. Evaluation of the Laplace matrix for FSI problems	187
4.6. The partitioned (or staggered) scheme	189
4.7. Numerical examples	195
4.7.1. Fluid column interacting with an elastic solid bottom	195
4.7.2. Mesh sensitivity analysis	200
4.7.3. 3D flexible flap in a converging channel	204
4.7.4. Experimental validation with aortic valve	207
4.7.5. Flexible valve in pulsatile flow	211
4.8. Conclusions	215
4.9. Acknowledgments	216
4.10. Bibliography	216
Chapter 5. Multidomain Finite Element Computations: Application to Multiphasic Problems	221
Thierry COUPEZ, Hugues DIGONNET, Elie HACHEM, Patrice LAURE, Luisa SILVA, Rudy VALETTE	
5.1. Introduction	221

5.1.1. A classification of multidomain approaches	222
5.1.2. Notations	224
5.1.2.1. Functional and discrete spaces	224
5.1.2.2. Bubble space	226
5.1.2.3. Element length definition	228
5.2. Characterization of different phases	228
5.2.1. The level set or signed distance functions	229
5.2.2. Mesh adaptation	231
5.2.3. Displacement of the level set function	235
5.2.3.1. The reinitialization	235
5.2.3.2. Convective reinitialization	236
5.2.3.3. The local distance function	237
5.2.3.4. Parameters of reinitialized and truncated convective equations	239
5.3. Stabilized finite element formulations	240
5.3.1. Multidomain Navier–Stokes equations	241
5.3.2. Weak formulation of incompressible Navier–Stokes equations	242
5.3.3. Stable multiscale variational approach for Navier–Stokes equations	243
5.3.3.1. The fine scale subproblem	245
5.3.3.2. The coarse scale subproblem	249
5.3.3.3. Time advancing	252
5.3.3.4. Matrix formulation of the problem	253
5.3.4. Stabilized weak formulation for convection equation	255
5.4. Multiphase problems with fluid–air and fluid–fluid interface	256
5.4.1. Two-dimensional Zalesak’s problem	257
5.4.2. Gravitational flow	258
5.4.3. The surface tension	262
5.5. Immersion of solid bodies in fluid	264
5.5.1. Immersed body having an imposed velocity	265
5.5.2. Velocity-pressure formulation for solid bodies in a fluid	268

5.5.3. Weak formulation of fluid/solid system . . .	271
5.5.4. Discrete formulation and Uzawa algorithm	271
5.5.5. Lagrangian particle displacement	272
5.5.6. A sphere in a shear flow	273
5.5.7. Two rigid spheres in stokes flow	276
5.5.7.1. Influence of mesh	276
5.5.7.2. Particle displacements	277
5.6. Conclusion	281
5.7. Acknowledgements	282
5.8. Bibliography	282
List of Authors	291
Index	293
