<b>FOREWORD BY J.F. BOOKER</b> . . . . .	ix
<b>FOREWORD BY JEAN FRÊNE</b> . . . . .	xiii
<b>PREFACE</b> . . . . .	xvii
<b>NOMENCLATURE</b> . . . . .	xxiii
<b>CHAPTER 1. THE LUBRICANT</b> . . . . .	1
1.1. Description of lubricants . . . . .	1
1.2. The viscosity . . . . .	2
1.2.1. Viscosity – temperature relationship . . . . .	4
1.2.2. Viscosity – pressure relationship . . . . .	6
1.2.3. Viscosity – pressure – temperature relationship . . . . .	7
1.2.4. Non-Newtonian behavior. . . . .	10
1.3. Other lubricant properties. . . . .	12
1.4. Lubricant classification and notation. . . . .	14
1.5. Bibliography . . . . .	15
<b>CHAPTER 2. EQUATIONS OF HYDRODYNAMIC LUBRICATION.</b> . . . . .	17
2.1. Hypothesis . . . . .	17
2.2. Equation of generalized viscous thin films . . . . .	18
2.3. Equations of hydrodynamic for journal and thrust bearings . . . . .	20
2.3.1. Specific case of an incompressible fluid . . . . .	21
2.3.2. Standard Reynolds equation for a journal bearing: general case . . . . .	22
2.3.3. Reynolds equation for a thrust bearing: general case . . . . .	23

---

2.3.4. Equation of volume flow rate . . . . .	24
2.3.5. Equations of hydrodynamic for journal and thrust bearings lubricated with an isoviscous incompressible fluid . . . . .	25
2.4. Film rupture; second form of Reynolds equation . . . . .	26
2.5. Particular form of the viscous thin film equation in the case of wall slipping . . . . .	32
2.6. Boundary conditions; lubricant supply . . . . .	35
2.6.1. Conditions on bearing edges . . . . .	36
2.6.2. Conditions for circular continuity . . . . .	36
2.6.3. Conditions on non-active zone boundaries . . . . .	37
2.6.4. Boundary conditions for supply orifices . . . . .	40
2.7. Flow rate computation . . . . .	43
2.7.1. First assumptions . . . . .	44
2.7.2. Model and additional assumptions . . . . .	45
2.7.3. Pressure expression for the full film fringes on the bearing edges . . . . .	46
2.7.4. Evolution of the width of the full film fringes on the bearing edges . . . . .	47
2.7.5. Computation of the flow rate for lubricant entering by the bearing sides . . . . .	51
2.8. Computation of efforts exerted by the pressure field and the shear stress field: journal bearing case . . . . .	51
2.9. Computation of efforts exerted by the pressure field and the shear stress field: thrust bearing case . . . . .	54
2.10. Computation of viscous dissipation energy: journal bearing case . . . . .	57
2.11. Computation of viscous dissipation energy: thrust bearing case . . . . .	59
2.12. Different flow regimes . . . . .	59
2.13. Bibliography . . . . .	61
<b>CHAPTER 3. NUMERICAL RESOLUTION OF THE REYNOLDS EQUATION . . . . .</b>	<b>63</b>
3.1. Definition of the problems to be solved . . . . .	64
3.1.1. Problem 1: determining the pressure . . . . .	64
3.1.2. Problem 2: determining of the pressure and the lubricant filling . . . . .	65
3.1.3. Other problems . . . . .	68
3.2. The finite difference method . . . . .	70
3.2.1. Computation grid . . . . .	71
3.2.2. Discretization of standard Reynolds equation (problem 1) . . . . .	71
3.2.3. Discretization of modified Reynolds equation (problem 2) . . . . .	74
3.3. The finite volume method . . . . .	82
3.3.1. Mesh of the film domain . . . . .	83
3.3.2. Discretization of the standard Reynolds equation (problem 1) . . . . .	84
3.3.3. Discretization of modified Reynolds equation (problem 2) . . . . .	86

---

3.4. The finite element method . . . . .	90
3.4.1. Integral formulation of standard Reynolds equation . . . . .	90
3.4.2. Integral formulation of modified Reynolds equation . . . . .	92
3.4.3. Approximation of integral formulations: method of Galerkin weighted residuals . . . . .	98
3.4.4. Approximation of problem 1* . . . . .	99
3.4.5. Approximation of problem 2* . . . . .	105
3.5. Discretizations of time derivatives . . . . .	108
3.5.1. Discretization by finite differences . . . . .	108
3.5.2. Discretization by time finite elements . . . . .	109
3.5.3. Adaptation of discretized expressions for equations to be solved . . . . .	113
3.6. Comparative analysis of the different methods . . . . .	114
3.6.1. Definition of reference problems . . . . .	114
3.6.2. First numerical tests . . . . .	115
3.6.3. Comparisons between the three discretization methods for a static case . . . . .	121
3.6.4. Comparisons between linear and quadratic discretizations for the finite element method applied to the standard Reynolds equation . . . . .	124
3.6.5. Comparisons between the different discretizations of time derivatives for the modified Reynolds equation . . . . .	127
3.6.6. Aptitude of the various discretizations of time derivatives to follow sudden load change . . . . .	136
3.6.7. Case of a bearing under a dynamic load rotating with a frequency equal to half of the shaft frequency . . . . .	143
3.7. Accounting of film thickness discontinuities . . . . .	146
3.8. Numerical algorithm for computing bearing axial flow rate . . . . .	149
3.8.1. Pressure gradient computing in the case of a finite element discretization . . . . .	149
3.8.2. Computation of axial flow rate . . . . .	151
3.8.3. Algorithm for computing the axial flow rate . . . . .	153
3.8.4. Example . . . . .	155
3.9. Bibliography . . . . .	155
<b>CHAPTER 4. ELASTOHYDRODYNAMIC LUBRICATION . . . . .</b>	<b>159</b>
4.1. Bearings with elastic structure . . . . .	160
4.1.1. Thickness of the lubricant film . . . . .	160
4.1.2. Film domain discretization . . . . .	162
4.2. Elasticity accounting: compliance matrices . . . . .	163
4.2.1. Surface forces due to pressure . . . . .	163
4.2.2. Volume forces due to inertia effects . . . . .	174

4.3. Accounting of shaft elasticity . . . . .	178
4.4. Particular case of non-conformal meshes . . . . .	180
4.5. Bibliography . . . . .	184
<b>APPENDIX</b> . . . . .	185
<b>INDEX</b> . . . . .	189
