Foreword xi

PART 1. INSTANTANEOUS OR TIME-INDEPENDENT MODELS FOR CONCRETE 1

Chapter 1. Test Techniques and Experimental Characterization 3
Nicolas BURLION

1.1. Introduction 3
1.2. Experimental specificities related to concrete material 4
1.2.1. Composition and variability of the material 4
1.2.2. Specimen preparation 6
1.2.3. Preservation and curing conditions 9
1.2.4. Size effect 11
1.3. Extensometers and experimental conditions 12
1.3.1. Classical extensometry on a concrete specimen 12
1.3.2. Boundary conditions and experimental set-up 17
1.4. Behavior of concrete under uniaxial stress: classical tests 21
1.4.1. Direct uniaxial tension 22
1.4.2. Indirect uniaxial tension 23
1.4.3. Diffuse tension test 26
1.4.4. Bi-tube tension test 27
1.4.5. Uniaxial compression 27
1.4.6. Uniaxial torsion 32
1.5. Concrete under multiaxial stresses 32
1.5.1. Multiaxial stresses with tension 34
1.5.2. Biaxial compression 35
1.5.3. Triaxial compression 35

1.6. Conclusions regarding the experimental characterization of the multiaxial behavior of concrete 54
1.7. Bibliography 55

Chapter 2. Modeling the Macroscopic Behavior of Concrete 63
Jean-Marie REYNOUARD, Jean-François GEORGIN, Khalil HAIDAR and Gilles PIJAUDIER-CABOT

2.1. Introduction. 63
2.2. The discrete approach. 65
2.2.1. Fracture mechanics – elements for the analysis of cracked areas. 65
2.2.2. Discrete approach to cracking 66
2.2.3. Hillerborg's fictitious crack model. 69
2.3. Continuous approach 71
2.3.1. Damage mechanics 71
2.3.2. Plasticity theory. 85
2.4. Conclusion 106
2.5. Bibliography 115

Chapter 3. Failure and Size Effect of Structural Concrete. 121
Gilles PIJAUDIER-CABOT and Khalil HAIDAR

3.1. Introduction. 121
3.2. Probabilistic structural size effect. 124
3.2.1. Basics of the weakest link theory 124
3.2.2. Generalized probabilistic size effect law 127
3.3. Deterministic size effect 130
3.4. Fractality and size effect 134
3.4.1. Basis of the fractal approach 135
3.4.2. Fractality of the fracture surface and fracture energy. 136
3.4.3. Lacunar fractality and multifractality of the nominal stress at failure 137
3.5. Size effect and calibration of non-local models. 138
3.5.1. Description of size effect according to the non-local damage model. 141
3.5.2. Calibration of internal length from size effect test data 142
3.6. Conclusions. 143
3.7. Acknowledgement. 145
3.8. Bibliography 145

PART 2. CONCRETE UNDER CYCLIC AND DYNAMIC LOADING 149

Chapter 4. Cyclic Behavior of Concrete and Reinforced Concrete 151
Jean-François DUBÉ

4.1. Characterization tests of the cyclic behavior 151
4.1.1. Uniaxial cyclic behavior 152
4.1.2. Cyclic tests on structural elements 156
4.1.3. Conclusions 162
4.2. Modeling the reinforced concrete cyclic behavior 163
4.2.1. Thermodynamic-based model with crack closure 164
4.2.2. Distributed cracking models 166
4.2.3. Microplane model 168
4.3. Modeling of the cyclic behavior of concrete 170
4.3.1. Characteristics of the cyclic behavior and their influence 170
4.3.2. Influence of the loading rate 179
4.4. Conclusions 180
4.5. Bibliography 181

Chapter 5. Cyclic and Dynamic Loading Fatigue of Structural Concrete . 185
Jean-François DESTREBECQ

5.1. Introduction 185
5.2. The mechanisms of concrete fatigue 186
5.2.1. Nature of the phenomenon 186
5.2.2. Fatigue strength and number of cycles to failure 188
5.2.3. Strains and damage 191
5.3. The fatigue strength under uniaxial compression or traction 193
5.3.1. Aas-Jakobsen's formula 193
5.3.2. S-N-R curves 194
5.3.3. Ros's diagram 195
5.3.4. Haigh's diagram 195
5.3.5. Goodman-Smith's diagram 196
5.4. Extension to Aas-Jakobsen's formula 197
5.4.1. Effect of the frequency and the cycle shape 197
5.4.2. Fatigue under alternate uniaxial loading 200
5.5. Fatigue under multiaxial loading 202
5.5.1. Fatigue in the presence of passive confinement 203
5.5.2. Fatigue under biaxial loading 205
5.5.3. Fatigue under triaxial cyclic loading 207
5.6. Fatigue under high-level cyclic loading 207
5.6.1. General principles for the analysis 209
5.6.2. Modified Aas-Jakobsen's formula 211

5.6.3. Formulas based upon the theories of damage 212
5.7. Fatigue strength under variable level cyclic loadings 214
5.7.1. Rule of linear accumulation 214
5.7.2. Rule of non-linear accumulation 216
5.7.3. Fatigue under random loading 217
5.8. Bibliography 219

Chapter 6. Rate-Dependent Behavior and Modeling for Transient Analyses 225
Fabrice GATUINGT

6.1. Introduction 225
6.2. Experimental behavior 225
6.2.1. Dynamic behavior in uniaxial compression 226
6.2.2. Dynamic behavior in uniaxial tension 228
6.2.3. Dynamic behavior in multiaxial loading 234
6.3. Behavior modeling of concrete in dynamics 240
6.3.1. Modeling of dynamic failure of concrete using a viscoelastic viscoplastic damage continuum model 240
6.3.2. A damage model for the dynamic fragmentation of brittle solids 243
6.3.3. Anisotropic three-dimensional delay-damage model 247
6.3.4. Damage coupled to plasticity for high strain rate dynamics 252
6.4. Bibliography 261

PART 3. TIME-DEPENDENT RESPONSE OF CONCRETE 265

Chapter 7. Concrete at an Early Age: the Major Parameters 267
Vincent WALLER and Buqan MIAO

7.1. Introduction 267
7.2. Influence of the composition of concrete 267
7.2.1. Characteristics related to the temperature of concrete 268
7.2.2. Mechanical characteristics 278
7.3. Consequences of boundary conditions 282
7.3.1. Consequences of thermal boundary conditions 282
7.3.2. Consequences of hygrometric boundary conditions 285
7.3.3. Consequences of mechanical boundary conditions 288
7.4. Conclusion 290
7.5. Bibliography 290

Chapter 8. Modeling Concrete at an Early Age 297
Franz-Josef ULM, Jean-Michel TORRENTI, Benoît BISSONETTE and Jacques MARCHAND

8.1. Introduction. 297
8.2. The coupled thermo-chemo-mechanical problem 297
8.2.1. Macroscopic modeling of hydration 297
8.2.2. Identification of the hydration kinetics 306
8.2.3. Identification of the normalized affinity 307
8.3. Data collection and experimental methods 309
8.3.1. Degree of hydration 310
8.3.2. Volume changes 311
8.3.3. Mechanical behavior 321
8.4. Conclusion 331
8.5. Bibliography 331

Chapter 9. Delayed Effects – Creep and Shrinkage 339
Farid BENBOUDJEMA, Fékri MEFTAH, Grégory HEINFLING, Fabrice LEMAOU and Jean Michel TORRENTI

9.1. Introduction. 339
9.2. Definitions and mechanisms 340
9.2.1. Microstructure of cement paste. 341
9.2.2. Shrinkage. 342
9.2.3. Creep 348
9.3. Experimental approach 354
9.3.1. Tests 355
9.3.2. Testing equipment 357
9.3.3. Data processing 359
9.4. Delayed response modeling 361
9.4.1. Modeling drying 362
9.4.2. Modeling of the desiccation shrinkage 366
9.4.3. Creep modeling 371
9.4.4. Conclusion 382
9.5. Codified models 383
9.5.1. Goals and limitations of codified models 383
9.5.2. RILEM recommendations on codified models characteristics . . . 384
9.5.3. Comparison of the performance of the principal models currently proposed in the case of different codes in Europe and in the United States. 386
9.6. Conclusion 400
9.7. Bibliography 400

Closing Remarks: New Concretes, New Techniques, and Future Models 409
Jean Michel TORRENTI, Gilles PIJAUDIER-CABOT and Jean-Marie REYNOUARD

List of Authors 415
