

## Table of Contents

<b>Preface</b> . . . . .	xv
<b>Part 1. System Analysis</b> . . . . .	1
<b>Chapter 1. Transfer Functions and Spectral Models</b> . . . . .	3
Dominique BEAUVOIS and Yves TANGUY	
1.1. System representation . . . . .	3
1.2. Signal models . . . . .	4
1.2.1. Unit-step function or Heaviside step function $U(t)$ . . . . .	4
1.2.2. Impulse . . . . .	4
1.2.3. Sine-wave signal . . . . .	7
1.3. Characteristics of continuous systems . . . . .	7
1.4. Modeling of linear time-invariant systems . . . . .	8
1.4.1. Temporal model, convolution, impulse response and unit-step response . . . . .	8
1.4.2. Causality . . . . .	9
1.4.3. Unit-step response . . . . .	10
1.4.4. Stability . . . . .	10
1.4.5. Transfer function . . . . .	12
1.4.6. Causality, stability and transfer function . . . . .	16
1.4.7. Frequency response and harmonic analysis . . . . .	17
1.5. Main models . . . . .	21
1.5.1. Integrator . . . . .	21
1.5.2. First order system . . . . .	23
1.5.3. Second order system . . . . .	27
1.6. A few reminders on Fourier and Laplace transforms . . . . .	33
1.6.1. Fourier transform . . . . .	33
1.6.2. Laplace transform . . . . .	34
1.6.3. Properties . . . . .	38

1.6.4. Laplace transforms of ordinary causal signals . . . . .	40
1.6.5. Ordinary Fourier transforms . . . . .	41
1.7. Bibliography . . . . .	42
<b>Chapter 2. State Space Representation . . . . .</b>	<b>43</b>
Patrick BOUCHER and Patrick TURELLE	
2.1. Reminders on the systems . . . . .	44
2.1.1. Internal representation of determinist systems: the concept of state	44
2.1.2. Equations of state and equations of measurement for	
continuous systems. . . . .	46
2.1.3. Case of linear systems . . . . .	47
2.1.4. Case of continuous and invariant linear systems . . . . .	48
2.2. Resolving the equation of state . . . . .	48
2.2.1. Free state . . . . .	48
2.2.2. Forced state . . . . .	49
2.2.3. Particular case of linear and invariant systems. . . . .	50
2.2.4. Calculation method of the transition matrix $e^{A(t-t_0)}$ . . . . .	51
2.2.5. Application to the modeling of linear discrete systems. . . . .	55
2.3. Scalar representation of linear and invariant systems . . . . .	57
2.3.1. State passage $\rightarrow$ transfer. . . . .	57
2.3.2. Change of basis in the state space . . . . .	60
2.3.3. Transfer passage $\rightarrow$ state . . . . .	60
2.3.4. Scalar representation of invariant and linear discrete systems. . . . .	65
2.4. Controllability of systems . . . . .	66
2.4.1. General definitions . . . . .	66
2.4.2. Controllability of linear and invariant systems. . . . .	66
2.4.3. Canonic representation of partially controllable systems. . . . .	69
2.4.4. Scalar representation of partially controllable systems . . . . .	73
2.5. Observability of systems . . . . .	74
2.5.1. General definitions . . . . .	74
2.5.2. Observability of linear and invariant systems . . . . .	74
2.5.3. Case of partially observable systems . . . . .	77
2.5.4. Case of partially controllable and partially observable systems. . . . .	78
2.6. Bibliography . . . . .	79
<b>Chapter 3. Discrete-Time Systems . . . . .</b>	<b>81</b>
Philippe CHEVREL	
3.1. Introduction. . . . .	81
3.2. Discrete signals: analysis and manipulation. . . . .	83
3.2.1. Representation of a discrete signal. . . . .	83
3.2.2. Delay and lead operators . . . . .	84
3.2.3. z-transform. . . . .	85

3.3. Discrete systems (DLTI) . . . . .	88
3.3.1. External representation . . . . .	88
3.3.2. Internal representation . . . . .	89
3.3.3. Representation in terms of operator . . . . .	91
3.3.4. Transfer function and frequency response . . . . .	96
3.3.5. Time response of basic systems . . . . .	98
3.4. Discretization of continuous-time systems . . . . .	99
3.4.1. Discretization of analog signals . . . . .	100
3.4.2. Transfer function of the discretized system . . . . .	101
3.4.3. State representation of the discretized system . . . . .	102
3.4.4. Frequency responses of the continuous and discrete system. . . . .	103
3.4.5. The problem of sub-sampling. . . . .	104
3.4.6. The problem of over-sampling . . . . .	105
3.5. Conclusion . . . . .	107
3.6. Bibliography . . . . .	107
<b>Chapter 4. Structural Properties of Linear Systems. . . . .</b>	<b>109</b>
Michel MALABRE	
4.1. Introduction: basic tools for a structural analysis of systems. . . . .	109
4.1.1. Vector spaces, linear applications . . . . .	110
4.1.2. Invariant sub-spaces . . . . .	111
4.1.3. Polynomials, polynomial matrices . . . . .	113
4.1.4. Smith form, companion form, Jordan form. . . . .	114
4.1.5. Notes and references . . . . .	115
4.2. Beams, canonical forms and invariants . . . . .	115
4.2.1. Matrix pencils and geometry . . . . .	117
4.2.2. Kronecker's canonical form. . . . .	118
4.2.3. Controllable, observable canonical form (Brunovsky) . . . . .	121
4.2.4. Morse's canonical form . . . . .	125
4.2.5. Notes and references . . . . .	128
4.3. Invariant structures under transformation groups. . . . .	128
4.3.1. Controllability indices . . . . .	128
4.3.2. Observability indices. . . . .	129
4.3.3. Infinite zeros. . . . .	129
4.3.4. Invariants, transmission finite zeros . . . . .	131
4.3.5. Notes and references . . . . .	132
4.4. An introduction to a structural approach of the control . . . . .	132
4.4.1. Disturbance rejection and decoupling: existence of solutions. . . . .	133
4.4.2. Disturbance rejection and decoupling: existence of stable solutions . . . . .	135
4.4.3. Disturbance rejection and decoupling: flexibility in the location of poles/fixed poles . . . . .	135
4.4.4. Notes and references . . . . .	136

4.5. Conclusion . . . . .	137
4.5.1. Optimal attenuation of disturbance . . . . .	137
4.6. Bibliography . . . . .	137
<b>Chapter 5. Signals: Deterministic and Statistical Models . . . . .</b>	<b>141</b>
Eric LE CARPENTIER	
5.1. Introduction. . . . .	141
5.2. Signals and spectral analysis. . . . .	141
5.3. Generator processes and ARMA modeling . . . . .	150
5.4. Modeling of LTI systems and ARMAX modeling . . . . .	153
5.4.1. ARX modeling . . . . .	153
5.4.2. ARMAX modeling . . . . .	154
5.4.3. Output error model . . . . .	154
5.4.4. Representation of the ARMAX model within the state space . . . . .	155
5.4.5. Predictor filter associated with the ARMAX model . . . . .	155
5.5. From the Markovian system to the ARMAX model . . . . .	156
5.6. Bibliography . . . . .	157
<b>Chapter 6. Kalman's Formalism for State Stabilization and Estimation . . . . .</b>	<b>159</b>
Gilles DUC	
6.1. The academic problem of stabilization through state feedback . . . . .	159
6.2. Stabilization by pole placement . . . . .	161
6.2.1. Results . . . . .	161
6.2.2. Example . . . . .	163
6.3. Reconstruction of state and observers . . . . .	164
6.3.1. General principles . . . . .	164
6.3.2. Continuous-time observer . . . . .	165
6.3.3. Discrete-time observer . . . . .	166
6.3.4. Calculation of the observer by pole placement. . . . .	167
6.3.5. Behavior of the observer outside the ideal case . . . . .	168
6.3.6. Example . . . . .	169
6.4. Stabilization through quadratic optimization . . . . .	171
6.4.1. General results for continuous-time . . . . .	171
6.4.2. General results for discrete-time . . . . .	173
6.4.3. Interpretation of the results . . . . .	174
6.4.4. Example . . . . .	175
6.5. Resolution of the state reconstruction problem by duality of the quadratic optimization . . . . .	177
6.5.1. Calculation of a continuous-time observer . . . . .	177
6.5.2. Calculation of a discrete-time observer . . . . .	178
6.5.3. Interpretation in a stochastic context . . . . .	179
6.5.4. Example . . . . .	181

6.6. Control through state feedback and observers . . . . .	183
6.6.1. Implementation of the control . . . . .	183
6.6.2. Dynamics of the looped system . . . . .	184
6.6.3. Interest and limitations of this result . . . . .	185
6.6.4. Interpretation in the form of equivalent corrector . . . . .	186
6.6.5. Example . . . . .	187
6.7. A few words on the resolution of Riccati's equations . . . . .	189
6.8. Conclusion . . . . .	192
6.9. Bibliography . . . . .	192
<b>Chapter 7. Process Modeling . . . . .</b>	<b>195</b>
Alain BARRAUD, Suzanne LESECQ and Sylviane GENTIL	
7.1. Introduction . . . . .	195
7.2. Modeling . . . . .	198
7.3. Graphic identification approached . . . . .	204
7.3.1. Pseudo-periodic unit-step response . . . . .	205
7.3.2. Aperiodic unit-step response . . . . .	207
7.3.3. Partial conclusion . . . . .	213
7.4. Identification through criterion optimization . . . . .	214
7.4.1. Algorithms . . . . .	214
7.4.2. Models . . . . .	215
7.4.3. Methods . . . . .	215
7.4.4. Optimization criteria . . . . .	216
7.4.5. The problem of precision . . . . .	217
7.4.6. How to optimize . . . . .	218
7.4.7. Partial conclusion . . . . .	219
7.4.8. Practical application . . . . .	220
7.5. Conclusion around an example . . . . .	222
7.5.1. Simulated procedure . . . . .	222
7.5.2. In search of a model . . . . .	223
7.6. Bibliography . . . . .	226
<b>Chapter 8. Simulation and Implementation of Continuous Time Loops . . . . .</b>	<b>227</b>
Alain BARRAUD and Sylviane GENTIL	
8.1. Introduction . . . . .	227
8.1.1. About linear equations . . . . .	228
8.1.2. About non-linear equations . . . . .	228
8.2. Standard linear equations . . . . .	228
8.2.1. Definition of the problem . . . . .	228
8.2.2. Solving principle . . . . .	229
8.2.3. Practical implementation . . . . .	229
8.3. Specific linear equations . . . . .	231
8.3.1. Definition of the problem . . . . .	231

8.3.2. Solving principle . . . . .	232
8.3.3. Practical implementation . . . . .	233
8.4. Stability, stiffness and integration horizon . . . . .	234
8.5. Non-linear differential systems . . . . .	235
8.5.1. Preliminary aspects . . . . .	235
8.5.2. Characterization of an algorithm . . . . .	236
8.5.3. Explicit algorithms . . . . .	239
8.5.4. Multi-interval implicit algorithms . . . . .	240
8.5.5. Solver for stiff systems . . . . .	242
8.5.6. Partial conclusion . . . . .	243
8.6. Discretization of control laws . . . . .	244
8.6.1. Introduction . . . . .	244
8.6.2. Discretization . . . . .	244
8.6.3. Application to PID regulators . . . . .	247
8.7. Bibliography . . . . .	250
<b>Part 2. System Control . . . . .</b>	<b>251</b>
<b>Chapter 9. Analysis by Classic Scalar Approach . . . . .</b>	<b>253</b>
Houria SIGUERDIDJANE and Martial DEMERLÉ	
9.1. Configuration of feedback loops . . . . .	253
9.1.1. Open loop – closed loops . . . . .	253
9.1.2. Closed loop harmonic analysis . . . . .	255
9.2. Stability . . . . .	258
9.2.1. Nyquist criterion . . . . .	259
9.2.2. Routh’s algebraic criterion . . . . .	265
9.2.3. Stability margins . . . . .	267
9.3. Precision . . . . .	270
9.3.1. Permanent error . . . . .	272
9.3.2. Transitional error . . . . .	277
9.4. Parametric sensitivity . . . . .	278
9.4.1. Open loop sensitivity . . . . .	278
9.4.2. Closed loop sensitivity . . . . .	280
9.5. Bibliography . . . . .	282
<b>Chapter 10. Synthesis of Closed Loop Control Systems . . . . .</b>	<b>283</b>
Houria SIGUERDIDJANE and Martial DEMERLÉ	
10.1. Role of correctors: precision-stability dilemma . . . . .	283
10.1.1. Analysis of systems’ behavior . . . . .	284
10.1.2. Serial correction . . . . .	288
10.1.3. Parallel correction . . . . .	289
10.1.4. Correction by anticipation . . . . .	290
10.1.5. Conclusions . . . . .	292

10.2. Serial correction . . . . .	293
10.2.1. Correction by phase lead . . . . .	293
10.2.2. Correction by phase delay . . . . .	300
10.3. Correction by combined actions . . . . .	303
10.3.1. Transfer function . . . . .	303
10.4. Proportional derivative (PD) correction . . . . .	306
10.4.1. Transfer function . . . . .	306
10.5. Proportional integral (PI) correction . . . . .	307
10.5.1. Transfer function . . . . .	307
10.6. Proportional integral proportional (PID) correction . . . . .	310
10.6.1. Transfer function . . . . .	310
10.6.2. Experimental adjustment method . . . . .	313
10.7. Parallel correction . . . . .	315
10.7.1. General principle . . . . .	315
10.7.2. Simple tachymetric correction ( $C(p) = \lambda p$ ) . . . . .	317
10.7.3. Filtered tachymetric correction . . . . .	320
10.7.4. Correction of delay systems: Smith predictor . . . . .	323
10.8. Bibliography . . . . .	325
<b>Chapter 11. Robust Single-Variable Control through Pole Placement . . .</b>	<b>327</b>
Gérard THOMAS	
11.1. Introduction . . . . .	327
11.1.1. Guiding principles and notations . . . . .	327
11.1.2. Reminders on polynomial algebra . . . . .	329
11.2. The obvious objectives of the correction . . . . .	332
11.2.1. Internal stability . . . . .	332
11.2.2. Stationary behavior . . . . .	333
11.2.3. General formulation . . . . .	335
11.3. Resolution . . . . .	336
11.3.1. Resolution of a particular case . . . . .	337
11.3.2. General case . . . . .	342
11.4. Implementation . . . . .	344
11.4.1. First possibility . . . . .	345
11.4.2. Minimal representation . . . . .	345
11.4.3. Management of saturations . . . . .	349
11.5. Methodology . . . . .	354
11.5.1. Intuitive approach . . . . .	354
11.5.2. Reduction of the noise on the control by choice of degrees . . . . .	356
11.5.3. Choice of the dynamics of $A_m$ and $A_o$ . . . . .	357
11.5.4. Examples . . . . .	363
11.6. Conclusion . . . . .	370
11.7. Bibliography . . . . .	370

<b>Chapter 12. Predictive Control</b> . . . . .	373
Patrick BOUCHER and Didier DUMUR	
12.1. General principles of predictive control . . . . .	373
12.1.1. Anticipative aspect . . . . .	373
12.1.2. Explicit prediction of future behavior . . . . .	374
12.1.3. Optimization by minimization of a quadratic criterion . . . . .	374
12.1.4. Principle of the sliding horizon . . . . .	374
12.2. Generalized predictive control (GPC) . . . . .	376
12.2.1. Formulation of the control law . . . . .	376
12.2.2. Automatic synthesis of adjustment parameters . . . . .	380
12.2.3. Extension of the basic version . . . . .	382
12.3. Functional predictive control (FPC) . . . . .	389
12.3.1. Definition of numerical model . . . . .	390
12.3.2. Choice of a reference trajectory . . . . .	390
12.3.3. Object-model difference . . . . .	391
12.3.4. Structure of the future control . . . . .	391
12.3.5. Structure of the optimal predictor . . . . .	392
12.3.6. Definition of quadratic criterion, concept of match points . . . . .	393
12.3.7. Adjustment parameters . . . . .	394
12.4. Conclusion . . . . .	394
12.5. Bibliography . . . . .	396
<b>Chapter 13. Methodology of the State Approach Control</b> . . . . .	399
Philippe CHEVREL	
13.1. Introduction . . . . .	400
13.2. $H_2$ control . . . . .	402
13.2.1. Standards . . . . .	403
13.2.2. $H_2$ optimization . . . . .	407
13.2.3. $H_2$ – LQG . . . . .	412
13.2.4. $H_2$ – LTR . . . . .	414
13.2.5. Generalization of the $H_2$ standard problem . . . . .	416
13.2.6. Generalized $H_2$ problem and robust RPIS . . . . .	421
13.2.7. Discretization of the $H_2$ problem . . . . .	423
13.3. Data of a feedback control problem . . . . .	426
13.3.1. Model of the process . . . . .	427
13.3.2. Modeling the environment of the system to adjust . . . . .	428
13.3.3. Additional data . . . . .	430
13.4. Standard $H_2$ optimization problem . . . . .	431
13.4.1. Construction of the conceptual control model . . . . .	431
13.4.2. Definition of the $H_2$ optimization problem . . . . .	433
13.4.3. The interest in standardization . . . . .	435
13.4.4. Management of the control compromises . . . . .	436
13.5. Conclusion . . . . .	437

13.6. Appendices . . . . .	438
13.6.1. Resolution of the Lyapunov equations. . . . .	438
13.6.2. Duality principle. . . . .	439
13.6.3. Another useful interpretation of grammians . . . . .	440
13.6.4. Zeros of a multivariable system. . . . .	440
13.6.5. Standardization of a system . . . . .	441
13.7. Bibliography . . . . .	441
<b>Chapter 14. Multi-variable Modal Control . . . . .</b>	<b>445</b>
Yann LE GORREC and Jean-Francois MAGNI	
14.1. Introduction . . . . .	445
14.2. The eigenstructure . . . . .	446
14.2.1. Notations . . . . .	446
14.2.2. Relations among signals, modes and eigenstructures . . . . .	448
14.3. Modal analysis . . . . .	453
14.3.1. Introduction . . . . .	453
14.3.2. Modal simulation . . . . .	453
14.3.3. Controllability . . . . .	455
14.4. Traditional methods for eigenstructure placement . . . . .	457
14.4.1. Modal specifications . . . . .	458
14.4.2. Choice of eigenvectors of the closed loop. . . . .	460
14.4.3. State feedback and output elementary static feedback . . . . .	465
14.5. Eigenstructure placement as observer . . . . .	468
14.5.1. Elementary observers. . . . .	468
14.5.2. Observer synthesis . . . . .	469
14.5.3. Synthesis of output dynamic feedback in the form of observer . . . . .	471
14.6. Conclusion . . . . .	476
14.7. Bibliography . . . . .	477
<b>Chapter 15. Robust <math>H_\infty</math>/LMI Control. . . . .</b>	<b>479</b>
Gilles DUC	
15.1. The $H_\infty$ approach . . . . .	480
15.1.1. The $H_\infty$ standard problem . . . . .	480
15.1.2. Example. . . . .	482
15.1.3. Resolution methods. . . . .	488
15.1.4. Resolution of $H_\infty$ standard problem through the Riccati equations. . . . .	488
15.1.5. Resolution of the $H_\infty$ standard problem by LMI . . . . .	490
15.1.6. Restricted synthesis on the corrector order . . . . .	493
15.2. The $\mu$ -analysis . . . . .	493
15.2.1. Analysis diagram and structured single value . . . . .	495
15.2.2. Main results of robustness . . . . .	495
15.2.3. Example. . . . .	496

15.2.4. Evaluation of structured single value . . . . .	500
15.3. The $\mu$ -synthesis . . . . .	502
15.3.1. A $H_\infty$ robust synthesis . . . . .	502
15.3.2. Approach by D-K iterations . . . . .	504
15.3.3. Example . . . . .	506
15.4. Synthesis of a corrector depending on varying parameters . . . . .	507
15.4.1. Problem considered and $L_2$ gain . . . . .	507
15.4.2. Polytopic approach . . . . .	509
15.4.3. A more general approach . . . . .	512
15.4.4. Example . . . . .	515
15.5. Conclusion . . . . .	518
15.6. Bibliography . . . . .	518
<b>Chapter 16. Linear Time-Variant Systems . . . . .</b>	<b>521</b>
Michel GUGLIELMI	
16.1. Ring of non-commutative polynomials . . . . .	522
16.1.1. Division and the right highest divisor (RHD) . . . . .	523
16.1.2. Right least common multiple (RLCM) . . . . .	523
16.1.3. Explicit formulation of RLCM . . . . .	524
16.1.4. Factoring, roots, relations with the coefficients . . . . .	524
16.2. Body of rational fractions . . . . .	525
16.3. Transfer function . . . . .	526
16.3.1. Properties of transfer functions . . . . .	527
16.3.2. Normal modes . . . . .	528
16.3.3. Stability . . . . .	528
16.4. Algebra of non-stationary linear systems . . . . .	529
16.4.1. Serial systems . . . . .	529
16.4.2. Parallel systems . . . . .	530
16.5. Applications . . . . .	531
