Preface	ix
Chapter 1. Applications of Ultra Wide Band Systems.	1
Serge HÉTHUIN and Isabelle BUCAILLE	
1.1. Introduction.	1
1.2. UWB regulation: a complex context	2
1.2.1. UWB regulation in the USA	2
1.2.2. UWB regulation in Europe	3
1.2.3. UWB regulation in Japan	6
1.2.4. Emission mask in the United States, Europe and Japan	7
1.3. Formal Ultra Wide Band types	8
1.3.1. Ultra Wide Band Impulse Radio (UWB-IR)	8
1.3.2. OFDM-ultra wide band (UWB-OFDM)	12
1.4. Non-formal ultra wide band types	14
1.4.1. Ultra wide band frequency hopping (UWB-FH).	14
1.4.2. Chirp Ultra Wide Band (UWB-FM).	17
1.5. Comparison between the different Ultra Wide Band techniques.	20
1.6. Typical UWB-OFDM applications	21
1.6.1. Peripheral connection to a PC	21
1.6.2. High speed applications in large structures with optical fiber backbone	22
1.6.3. High speed UWB in a harsh indoor environment	26
1.6.4. High speed UWB combined with other technologies.	27
1.7. Specialized UWB-OFDM applications	28
1.7.1. Last mile radio applications.	28
1.7.2. Information and video streaming applications	29
1.8. Typical applications of the Impulse Radio UWB, UWB-FH and UWB-FM	30

1.8.1. Professional geo-localization	30
1.8.2. Geolocalization for private individuals	31
1.9. Impact on the antennas	32
Chapter 2. Radiation Characteristics of Antennas.	33
Xavier BEGAUD	
2.1. Introduction.	33
2.1.1. What is an antenna and how can we define it?	36
2.1.2. Where does antenna radiation come from?	37
2.2. How can we characterize an antenna?	37
2.2.1. Plane wave and polarization	38
2.3. Radiation fields and radiation power	40
2.3.1. Radiation fields	40
2.3.2. Radiation power.	41
2.3.3. The radiation pattern, the phase center	41
2.3.4. Directive gain, directivity	43
2.3.5. Radiation impedance and radiation resistance	46
2.4. Gain, efficiency and effective aperture.	47
2.4.1. Gain and efficiency.	47
2.4.2. Receive antenna effective aperture.	48
2.5. Budget link, transfer function	49
2.6. Equivalent circuits of the antennas	51
2.7. Bandwidth	52
2.8. Example of characterization: the triangular probe antenna in F	52
2.8.1. Description of the structure	53
2.8.2. Impedance matching	53
2.8.3. Radiation patterns.	54
2.8.4. Optimization of the antenna.	58
Chapter 3. Representation, Characterization and Modeling of Ultra Wide Band Antennas.	61
Christophe ROBLIN	
3.1. Introduction.	61
3.2. Specificities of UWB antennas: stakes and representation	62
3.2.1. Context and requirements of an effective and complete representation	63
3.2.2. Transfer function in transmission	64
3.2.3. Transfer function in reception, reciprocity	71
3.2.4. Transfer function and “conventional” quantities	75
3.2.5. Elements on the measurement of transfer functions in the frequency domain.	76
3.3. Temporal behavior, distortion	77

3.4. Distortion and ideality	80
3.5. Performance characterization: synthetic indicators	82
3.5.1. Energy gain and mean realized gain (MRG)	83
3.5.2. Synthetic indicators of distortion	86
3.6. Parsimonious representation by development of singularities and spherical modes	95
3.6.1. The singularity expansion method	95
3.6.2. Spherical mode expansion method (SMEM)	98
3.6.3. Parametric model with very high order reduction	102
3.6.4. Examples of processing of measured ATF	103
Chapter 4. Experimental Characterization of UWB Antennas	113
Christophe DELAVEAUD	
4.1. Introduction	113
4.2. Measurements of the characteristics of radiation	114
4.2.1. Basic concepts	114
4.2.2. Frequency methods	117
4.2.3. Time domain method	127
4.3. Measurements of the electric characteristics	156
4.3.1. Preamble	156
4.3.2. Frequency domain measurements	157
4.3.3. Time domain measurements	159
Chapter 5. Overview of UWB Antennas	163
Nicolas FORTINO, Jean-Yves DAUVIGNAC, Georges KOSSIAVAS and Xavier BEGAUD	
5.1. Classification of UWB antennas	163
5.2. Frequency independent antennas	164
5.2.1. Equiangular antennas	164
5.2.2. Log-periodic antennas	170
5.2.3. Techniques of frequency-independent antennas performance improvement	176
5.3. Elementary antennas	177
5.3.1. The biconical antenna	177
5.3.2. The discone antenna	179
5.3.3. The bowtie antenna	180
5.3.4. Planar monopoles antennas	181
5.3.5. Performance improvement techniques of elementary UWB antennas	190
5.3.6. Directive elementary antennas	195
5.3.7. Antennas with progressive transition	196
5.3.8. Horn antennas	201

5.4. Miniaturization of UWB antennas	202
5.4.1. General principles of antenna miniaturization	202
5.4.2. Miniaturization problems of UWB antennas	203
5.4.3. Miniaturization techniques applicable to UWB antennas	204
5.5. UWB antennas for surface penetrating radars.	206
5.5.1. Presentation of SPR UWB technologies	206
5.5.2. Design of antennas for SPR radars.	207
Chapter 6. Antenna-Channel Joint Effects in UWB	213
Alain SIBILLE	
6.1. Introduction.	213
6.2. Recalls on the UWB radio channel	214
6.3. Impact of the channel on the performance of UWB systems	218
6.4. Effective antenna performance in an ideal channel	220
6.4.1. Introduction	220
6.4.2. Radiation patterns for various architectures	221
6.5. Effective performance of non-directional antennas in dispersive channels	225
6.5.1. Gain calculation for non-ideal antennas.	225
6.5.2. Results on measured channels	231
6.6. Effective performance of directional antennas in dispersive channels .	233
6.7. Factorization of antenna patterns	235
6.8. Conclusion	237
APPENDICES	239
Appendix A. Reciprocity of the Antennas in Reception and Transmission Modes	241
A.1. Reciprocity applied to waveguides.	243
A.2. Reciprocity applied to the passive antennas in transmission and reception	245
Appendix B. Method of the Stationary Phase	253
Acronyms and Abbreviations	255
Bibliography	259
List of Authors	273
Index	275
