Introduction	xiii
Mathieu GROSSARD, Stéphane RÉGNIER and Nicolas CHAILLET	
Chapter 1. Design of Integrated Flexible Structures for Micromanipulation	1
Mathieu GROSSARD, Mehdi BOUKALLEL, Stéphane RÉGNIER and Nicolas CHAILLET	
1.1. Design and control problems for flexible structures in micromanipulation	2
1.1.1. Characteristics of manipulation on the microscale	3
1.1.2. Reliability and positioning precision	5
1.1.3. Micromanipulation station	7
1.1.4. Difficulties related to controlling robotic micromanipulators	9
1.2. Integrated design in micromechatronics	11
1.2.1. Modeling integrated flexible structures	12
1.2.2. Active transduction materials	12
1.2.3. Multiphysical models	17
1.2.4. Optimization strategies for micromechatronic structures	20
1.3. Example of an optimal synthesis method for flexible piezoelectric transduction structures	25
1.3.1. Block method	26
1.3.2. General design approach	27
1.3.3. Finite element model	28

1.3.4. Example applications: designing integrated flexible microgrippers	29
1.4. Conclusion	31
1.5. Bibliography	32

**Chapter 2. Flexible Structures' Representation
and Notable Properties in Control 37**

Mathieu GROSSARD, Arnaud HUBERT, Stéphane RÉGNIER
and Nicolas CHAILLET

2.1. State-space representation of flexible structures	38
2.1.1. Dynamic representation	38
2.1.2. Conservative model in the modal basis	39
2.1.3. Damping characteristics	41
2.1.4. Solving equations	43
2.1.5. State-space representation in the modal basis	44
2.1.6. Modal identification and control	45
2.2. The concepts of modal controllability and observability	47
2.2.1. Overview of state controllability and observability	47
2.2.2. Interpretations of Gramians in the case of flexible structures	50
2.2.3. Writing Gramians in the modal basis	52
2.3. Reduction of models	52
2.3.1. Balanced realization	52
2.3.2. The Moore reduction technique	53
2.3.3. Modal and balanced realizations equivalence for flexible structures	55
2.4. Contribution of modal analysis criteria to topological optimization	56
2.4.1. Practical considerations in model reduction	56
2.4.2. Actuator/sensor collocation	58
2.4.3. Guiding the frequential response of the control transfer in the context of topological optimization	62
2.4.4. Modal observability criterion in structure optimization	62
2.4.5. High authority control (HAC)/low authority control (LAC) control	65
2.5. Conclusion	68
2.6. Bibliography	69

Chapter 3. Structured Energy Approach for the Modeling of Flexible Structures	73
Nandish R. CALCHAND, Arnaud HUBERT, Yann LE GORREC and Hector RAMIREZ ESTAY	
3.1. Introduction	73
3.2. Finite-dimensional systems	75
3.2.1. Classic energy models	76
3.2.2. Classic network models	79
3.2.3. Port-Hamiltonian formulation	89
3.3. Infinite-dimensional systems	95
3.3.1. Introductory example	95
3.3.2. Class of considered systems	101
3.3.3. Infinite-dimensional Dirac structure	102
3.3.4. Boundary control systems and stabilization	106
3.4. Conclusion	111
3.5. Bibliography	112
Chapter 4. Open-Loop Control Approaches to Compliant Micromanipulators	115
Yassine HADDAB, Vincent CHALVET and Micky RAKOTONDRABE	
4.1. Introduction	115
4.2. Piezoelectric microactuators	116
4.2.1. Compliant piezoelectric actuators	116
4.2.2. Hysteresis modeling and compensation	119
4.2.3. Modeling and compensating for badly damped vibration	122
4.3. Thermal microactuators	128
4.3.1. Thermal actuators	128
4.3.2. Modeling and identification	131
4.3.3. Bistable module using thermal actuators	136
4.3.4. Control	139
4.3.5. Digital microrobot	139
4.4. Conclusion	142
4.5. Bibliography	142

Chapter 5. Mechanical Flexibility and the Design of Versatile and Dexterous Grippers	145
Javier MARTIN AMEZAGA and Mathieu GROSSARD	
5.1. Robotic gripper systems	146
5.1.1. Robotic gripper	146
5.1.2. Versatile gripping concept	148
5.1.3. Dexterous manipulation concept	149
5.2. Actuation architecture and elastic elements	153
5.2.1. Actuation system	153
5.2.2. Modeling elastic transmissions in “simple-effect” actuation architecture	161
5.3. Structural flexibility	166
5.3.1. Compliant joints and precision issues	166
5.3.2. Design example of an interphalangeal joint for pluridigital manipulation	169
5.3.3. Deformable contact surfaces	173
5.4. Conclusion	177
5.5. Bibliography	178
Chapter 6. Flexible Tactile Sensors for Multidigital Dexterous In-hand Manipulation	181
Mehdi BOUKALLEL, Hanna YOUSEF, Christelle GODIN and Caroline COUTIER	
6.1. Introduction	181
6.2. Human dexterous manipulation as a basis for robotic manipulation	182
6.2.1. Human hand and finger movements	183
6.2.2. Tactile perception in the human hand	184
6.2.3. Functional specifications of tactile sensing for dexterous manipulation for robotics	186
6.3. Technologies for tactile sensing	188
6.3.1. Resistive sensors	188
6.3.2. Conductive polymers and fabrics	195
6.3.3. Conductive elastomer composites	197
6.3.4. Conductive fluids	201
6.3.5. Capacitive sensors	202
6.3.6. Piezoelectric sensors	206

6.3.7. Optical sensors	209
6.3.8. Organic field-effect transistors	212
6.4. A comparison of sensor solutions and sensing techniques	213
6.5. The Nail sensor	214
6.5.1. Description and working principle	217
6.5.2. Manufacturing process	218
6.6. From the Nail sensor to tactile skin	220
6.6.1. Flexible Nail sensor arrays	221
6.6.2. Dimensioning, materials and fabrication process	221
6.6.3. Signal addressing management: a challenge for large arrays and system integration	224
6.7. From tactile skin to artificial touch system	225
6.7.1. Sensor protection and force transmission	225
6.7.2. Texture analysis device based on the Nail sensor	226
6.8. Applications and signal analysis	228
6.8.1. Surface discrimination	228
6.8.2. Roughness estimation	231
6.8.3. Sensory analysis of materials	232
6.9. Summary and conclusion	233
6.10. Bibliography	235
Chapter 7. Flexures for High-Precision Manipulation Robots	243
Reymond CLAVEL, Simon HENEIN and Murielle RICHARD	
7.1. High-precision industrial robots background	243
7.1.1. Applications	243
7.1.2. Constraints linked to high-precision and proposed solution principles	245
7.1.3. Several examples of ultra-high-precision robots	246
7.2. Kinematic analysis of simple flexures	248
7.2.1. Flexure design	248
7.2.2. Degrees of freedom of an elementary joint	248
7.2.3. Parasitic movements	250
7.2.4. Rectilinear and circular flexures	259
7.3. Design method of parallel modular kinematics for flexures	260
7.3.1. Motivation	260
7.3.2. Modular design methodology	261
7.3.3. Application of the concept to very high-precision	263
7.3.4. Flexure-based mechanical design of bricks	264

7.4. Example of the Legolas 5 robot design	264
7.4.1. Flexure-based mechanical design	267
7.4.2. Prototype of the Legolas 5 robot	270
7.4.3. Very high-precision modular parallel robot family	271
7.5. Bibliography	273

Chapter 8. Modeling and Motion Control of Serial

Robots with Flexible Joints 275

Maria MAKAROV and Mathieu GROSSARD

8.1. Introduction	275
8.2. Modeling	276
8.2.1. Sources of flexibilities	276
8.2.2. Dynamic model	277
8.2.3. Reduced dynamic model properties	280
8.2.4. Simplified case study	281
8.3. Identification	284
8.3.1. Identification from additional sensors	286
8.3.2. Identification from motor measurements only	289
8.3.3. Discussion and openings	293
8.4. Motion control	295
8.4.1. Singular perturbation approach	296
8.4.2. Linearization and compensations	299
8.4.3. Particular control methods	304
8.5. Conclusion	310
8.6. Bibliography	310

Chapter 9. Dynamic Modeling of Deformable Manipulators 321

Frédéric BOYER and Ayman BELKHIRI

9.1. Introduction	321
9.2. Newton–Euler model of an elastic body	324
9.2.1. Poincaré equations applied to a rigid body: Newton–Euler model	325
9.2.2. Poincaré equations applied to the elastic body in the floating frame	329
9.2.3. Deformation parameterizing	334
9.3. Kinematic model of a deformable manipulator	337
9.4. Dynamic model of a deformable manipulator	340

9.5. Example	342
9.5.1. Description	342
9.5.2. Definition of imposed movements	344
9.6. Conclusion	346
9.7. Bibliography	346
Chapter 10. Robust Control of Robotic Manipulators with Structural Flexibilities	349
Housseem HALALCHI, Loïc CUVILLON, Guillaume MERCÈRE and Edouard LAROCHE	
10.1. Introduction	349
10.2. LTI methodology	350
10.2.1. A medical robotic problem	350
10.2.2. Modeling and identification	351
10.2.3. H_∞ control	354
10.2.4. Assessment of the linear control	357
10.3. Toward an LPV methodology	359
10.3.1. A manipulator with two flexible segments	359
10.3.2. Identification of an LPV model	363
10.3.3. Analysis and synthesis methods for LPV systems	368
10.3.4. Application to the flexible manipulator control	374
10.4. Conclusion	379
10.5. Bibliography	379
List of Authors	383
Index	385
